## AMINOTRIAZOLOPYRIDINES AND THEIR USE AS KINASE INHIBITORS

[0001] This application claims the benefit of U.S. Provisional Application No. 61/095,217, filed September 8, 2008, and U.S. Provisional Application No. 61/230,479, filed July 31, 2009, the entire contents of which are incorporated herein by reference.

1. FIELD

[0002] Provided herein are certain heteroaryl compounds, compositions comprising an effective amount of one or more such compounds and methods for treating or preventing cancer, inflammatory conditions, immunological conditions, metabolic conditions and conditions treatable or preventable by inhibition of a kinase or a kinase pathway, comprising administering an effective amount of a heteroaryl compound to a subject in need thereof.

2. BACKGROUND

[0003] The connection between abnormal protein phosphorylation and the cause or consequence of diseases has been known for over 20 years. Accordingly, protein kinases have become a very important group of drug targets. *See* Cohen, *Nature*, 1:309-315 (2002). Various protein kinase inhibitors have been used clinically in the treatment of a wide variety of diseases, such as cancer and chronic inflammatory diseases, including diabetes and stroke. *See* Cohen, *Eur. J. Biochem.*, 268:5001-5010 (2001).

[0004] The protein kinases are a large and diverse family of enzymes that catalyze protein phosphorylation and play a critical role in cellular signaling. Protein kinases may exert positive or negative regulatory effects, depending upon their target protein. Protein kinases are involved in specific signaling pathways which regulate cell functions such as, but not limited to, metabolism, cell cycle progression, cell adhesion, vascular function, apoptosis, inflammation, and angiogenesis. Malfunctions of cellular signaling have been associated with many diseases, the most characterized of which include inflammation, cancer and diabetes. The regulation of signal transduction by cytokines and the association of signal molecules with protooncogenes and tumor suppressor genes have been well documented. Similarly, the connection between diabetes and related conditions, and deregulated levels of protein kinases, has been demonstrated. *See e.g.*, Sridhar *et al. Pharmaceutical Research*, 17(11):1345-1353 (2000).

Viral infections and the conditions related thereto have also been associated with the regulation of protein kinases. Park *et al. Cell* 101 (7): 777-787 (2000).

[0005] Protein kinases can be divided into broad groups based upon the identity of the amino acid(s) that they target (serine/threonine, tyrosine, lysine, and histidine). For example, tyrosine kinases include receptor tyrosine kinases (RTKs), such as growth factors and non-receptor tyrosine kinases, such as the src kinase family. There are also dual-specific protein kinases that target both tyrosine and serine/threonine, such as cyclin dependent kinases (CDKs) and mitogen-activated protein kinases (MAPKs).

[0006] Because protein kinases regulate nearly every cellular process, including metabolism, cell proliferation, cell differentiation, and cell survival, they are attractive targets for therapeutic intervention for various disease states. For example, cell-cycle control and angiogenesis, in which protein kinases play a pivotal role are cellular processes associated with numerous disease conditions such as but not limited to cancer, inflammatory diseases, abnormal angiogenesis and diseases related thereto, atherosclerosis, macular degeneration, diabetes, obesity, and pain.

[0007] One of the key events in the signaling pathway following the activation of mast cells is activation of the tyrosine kinase Syk. Mast cells play a critical role in asthma and allergic disorders by releasing pro-inflammatory mediators and cytokines. Antigen-mediated aggregation of FcεRI, the high-affinity receptor for IgE, results in activation of mast cells. This triggers a series of signaling events resulting in the release of mediators, including histamine, proteases, leukotrienes and cytokines. These mediators cause increased vascular permeability, mucus production, bronchoconstriction, tissue degradation and inflammation, thus playing key roles in the etiology and symptoms of asthma and allergic disorders. Syk kinase acts as a central initiator of all subsequent signaling leading to mediator release. The critical role of Syk kinase in the signaling path was demonstrated by the complete inhibition of mediator release by a protein containing the SH2 domains of Syk kinase that functioned as an inhibitor of Syk kinase (J. A. Taylor *et al., Molec. and Cell Biol.*, 15: 4149-4157 (1995). Furthermore, direct clustering of Syk, introduced into a mast cell line as part of a chimeric transmembrane protein, was found to be sufficient to stimulate the events leading to mediator release normally induced by clustering of FcεRI (V. M. Rivera *et al., Molec. and Cell Biol.*, , 15: 1582-1590 (1995).

[0008] Activation and activity of Syk kinase is required for FcεRI -mediated release of mediators from mast cells. Therefore, agents that block the activity of Syk kinase act to block the

release of allergic and pro-inflammatory mediators and cytokines. These agents have potential utility in treating inflammatory and allergic disorders including asthma, chronic obstructive pulmonary disease (COPD), adult or acute respiratory distress syndrome (ARDS), ulcerative colitis, Crohn's disease, bronchitis, conjunctivitis, psoriasis, scleroderma, urticaria, dermatitis and allergic rhinitis.

[0009] In addition to mast cells, Syk is expressed in other hematopoietic cells including B cells, where it is thought to play an essential role in transducing signals required for the transition of immature B cells into mature recirculating B cells (M. Turner *et al.*, *Immunology Today*, 21: 148 (2000). B cells are reported to play an important role in some inflammatory conditions such as lupus (O. T. Chan *et al.*, *Immunological Rev*, 169: 107-121 (1999) and rheumatoid arthritis (A. Gause *et al.*, *Biodrugs*, 15(2): 73-79 (2001).

[0010] Syk was also reported to be an element of the signaling cascade in beta-amyloid and prion fibrils leading to production of neurotoxic products (C. K. Combs *et al.*, *J. Neurosci.*, 19: 928-939 (1999). Furthermore, an inhibitor of Syk blocked the production of these neurotoxic products. Thus Heteroaryl Compound would potentially be useful in the treatment of Alzheimer's disease and related neuroinflammatory diseases. Another report (Y. Kuno *et al.*, *Blood*, 97, 1050-1055 (2001) demonstrates that Syk plays an important role in malignant progression. A TEL-Syk fusion protein was found to transform hematopoietic cells suggesting a role in the pathogenesis of hematopoietic malignancies. Therefore Heteroaryl Compound may be useful in the treatment of certain types of cancers.

[0011] Other protein tyrosine kinases involved in hematologic malignancies include ABL (ABL1), ARG (ABL2), PDGF $\beta$ R, PDGF $\alpha$ R, JAK2, TRKC, FGFR1, FGFR3, FLT3, and FRK. The Janus kinases (JAK) are a family of tyrosine kinases consisting of JAK1, JAK2, JAK3 and TYK2. The JAKs play a critical role in cytokine signaling. The down-stream substrates of the JAK family of kinases include the signal transducer and activator of transcription (STAT) proteins. JAK/STAT signaling has been implicated in the mediation of many abnormal immune responses such as allergies, asthma, autoimmune diseases such as transplant (allograft) rejection, rheumatoid arthritis, amyotrophic lateral sclerosis and multiple sclerosis, as well as in solid and hematologic malignancies such as leukemia and lymphomas (for a review of the pharmaceutical intervention of the JAK/STAT pathway see Frank, *Mol. Med.* 5, 432:456 (1999), and Seidel *et al.*, *Oncogene* 19, 2645-2656 (2000). JAK2 is a well validated target with strong potential in the

treatment of myeloproliferative disorders (MPDs), which include polycythemia vera (PV), essential thrombocythemia, chronic idiopathic myelofibrosis, myeloid metaplasia with myelofibrosis, chronic myeloid leukemia, chronic myelomonocytic leukemia, chronic eosinophilic leukemia, hypereosinophilic syndrome and systematic mast cell disease.

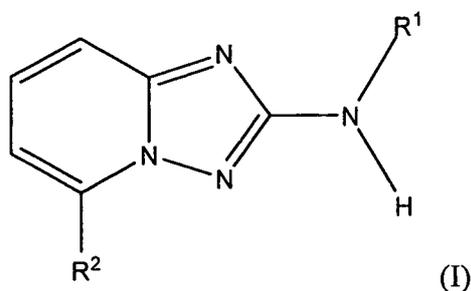

[0012] Fms-like tyrosine kinase 3 (FLT3), which is also known as FLK-2 (fetal liver kinase 2) and STK-I (stem cell kinase 1), plays an important role in the proliferation and differentiation of hematopoietic stem cells. FLT3 receptor kinase is expressed in normal hematopoietic cells, placenta, gonads, and brain. However, this enzyme is expressed at very high levels on the cells of more than 80% of myelogenous patients and of a fraction of acute lymphoblastic leukemia cells. Furthermore, the enzyme can also be found on cells from patients with chronic myelogenous leukemia in lymphoid blast crisis. It has been reported that FLT3 kinase is mutated in 30% of acute myeloid leukemia (AML) and in a subset of acute lymphoblastic leukemia (ALL) as well (Gilliland *et al*, *Blood* 100, 1532-1542 (2002); Stirewalt *et al*, *Nat. Rev. Cancer*, 3, 650-665 (2003). The most common activating mutations in FLT3 are internal tandem duplications within the juxtamembrane region, while point mutations, insertions, or deletions in the kinase domain are less common. Some of these mutant FLT3 kinases are constitutively active. FLT3 mutations have been associated with a poor prognosis (Malempati *et al*, *Blood*, 104, 11 (2004). More than a dozen known FLT3 inhibitors are being developed and some have shown promising clinical effects against AML (Levis *et al* *Int. J. Hematol.*, 52, 100- 107 (2005). It has been reported that some of small-molecule FLT3 inhibitors are effective in inducing apoptosis in cell lines with FLT3-activating mutations and prolonging survival of mice that express mutant FLT3 in their bone marrow cells (Levis *et al*, *Blood*, 99, 3885-3891 (2002); Kelly *et al*, *Cancer Cell*, 1, 421-432 (2002); Weisberg *et al*, *Cancer Cell*, 1, 433-443 (2002); Yee *et al*, *Blood*, 100, 2941-2949 (2002).

[0013] The elucidation of the intricacy of protein kinase pathways and the complexity of the relationship and interaction among and between the various protein kinases and kinase pathways highlights the importance of developing pharmaceutical agents capable of acting as protein kinase modulators, regulators or inhibitors that have beneficial activity on multiple kinases or multiple kinase pathways. Accordingly, there remains a need for new kinase modulators.

**[0044]** As used herein and unless otherwise indicated, the term "solvate" means a Heteroaryl Compound, or a salt thereof, that further includes a stoichiometric or non-stoichiometric amount of a solvent bound by non-covalent intermolecular forces. In some embodiments, the solvate is a hydrate. As used herein and unless otherwise indicated, the term "hydrate" means a Heteroaryl Compound, or a salt thereof, that further includes a stoichiometric or non-stoichiometric amount of water bound by non-covalent intermolecular forces.

**[0045]** As used herein and unless otherwise indicated, the term "prodrug" means a Heteroaryl Compound derivative that can hydrolyze, oxidize, or otherwise react under biological conditions (*in vitro* or *in vivo*) to provide an active compound, particularly a Heteroaryl Compound. Examples of prodrugs include, but are not limited to, derivatives and metabolites of a Heteroaryl Compound that include biohydrolyzable moieties such as biohydrolyzable amides, biohydrolyzable esters, biohydrolyzable carbamates, biohydrolyzable carbonates, biohydrolyzable ureides, and biohydrolyzable phosphate analogues. In certain embodiments, prodrugs of compounds with carboxyl functional groups are the lower alkyl esters of the carboxylic acid. The carboxylate esters are conveniently formed by esterifying any of the carboxylic acid moieties present on the molecule. Prodrugs can typically be prepared using well-known methods, such as those described by *Burger's Medicinal Chemistry and Drug Discovery* 6<sup>th</sup> ed. (Donald J. Abraham *ed.*, 2001, Wiley) and *Design and Application of Prodrugs* (H. Bundgaard *ed.*, 1985, Harwood Academic Publishers Gmfh).

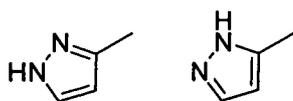

**[0046]** As used herein and unless otherwise indicated, the term "stereoisomer" or "stereomerically pure" means one stereoisomer of a Heteroaryl Compound that is substantially free of other stereoisomers of that compound. For example, a stereomerically pure compound having one chiral center will be substantially free of the opposite enantiomer of the compound. A stereomerically pure compound having two chiral centers will be substantially free of other diastereomers of the compound. A typical stereomerically pure compound comprises greater than about 80% by weight of one stereoisomer of the compound and less than about 20% by

weight of other stereoisomers of the compound, greater than about 90% by weight of one stereoisomer of the compound and less than about 10% by weight of the other stereoisomers of the compound, greater than about 95% by weight of one stereoisomer of the compound and less than about 5% by weight of the other stereoisomers of the compound, or greater than about 97% by weight of one stereoisomer of the compound and less than about 3% by weight of the other stereoisomers of the compound. The Heteroaryl Compounds can have chiral centers and can occur as racemates, individual enantiomers or diastereomers, and mixtures thereof. All such isomeric forms are included within the embodiments disclosed herein, including mixtures thereof.

**[0047]** The use of stereomerically pure forms of such Heteroaryl Compounds, as well as the use of mixtures of those forms are encompassed by the embodiments disclosed herein. For example, mixtures comprising equal or unequal amounts of the enantiomers of a particular Heteroaryl Compound may be used in methods and compositions disclosed herein. These isomers may be asymmetrically synthesized or resolved using standard techniques such as chiral columns or chiral resolving agents. *See, e.g.,* Jacques, J., *et al., Enantiomers, Racemates and Resolutions* (Wiley-Interscience, New York, 1981); Wilen, S. H., *et al., Tetrahedron* 33:2725 (1977); Eliel, E. L., *Stereochemistry of Carbon Compounds* (McGraw-Hill, NY, 1962); and Wilen, S. H., *Tables of Resolving Agents and Optical Resolutions* p. 268 (E.L. Eliel, Ed., Univ. of Notre Dame Press, Notre Dame, IN, 1972).

**[0048]** It should also be noted the Heteroaryl Compounds can include E and Z isomers, or a mixture thereof, and cis and trans isomers or a mixture thereof. In certain embodiments, the Heteroaryl Compounds are isolated as either the E or Z isomer. In other embodiments, the Heteroaryl Compounds are a mixture of the E and Z isomers.

**[0049]** "Tautomers" refers to isomeric forms of a compound that are in equilibrium with each other. The concentrations of the isomeric forms will depend on the environment the compound is found in and may be different depending upon, for example, whether the compound is a solid or is in an organic or aqueous solution. For example, in aqueous solution, pyrazoles may exhibit the following isomeric forms, which are referred to as tautomers of each other:

[0050] As readily understood by one skilled in the art, a wide variety of functional groups and other structures may exhibit tautomerism and all tautomers of compounds of formula (I) are within the scope of the present invention.

[0051] It should also be noted the Heteroaryl Compounds can contain unnatural proportions of atomic isotopes at one or more of the atoms. For example, the compounds may be radiolabeled with radioactive isotopes, such as for example tritium ( $^3\text{H}$ ), iodine-125 ( $^{125}\text{I}$ ), sulfur-35 ( $^{35}\text{S}$ ), or carbon-14 ( $^{14}\text{C}$ ), or may be isotopically enriched, such as with deuterium ( $^2\text{H}$ ), carbon-13 ( $^{13}\text{C}$ ), or nitrogen-15 ( $^{15}\text{N}$ ). As used herein, an "isotopologue" is an isotopically enriched compound. The term "isotopically enriched" refers to an atom having an isotopic composition other than the natural isotopic composition of that atom. "Isotopically enriched" may also refer to a compound containing at least one atom having an isotopic composition other than the natural isotopic composition of that atom. The term "isotopic composition" refers to the amount of each isotope present for a given atom. Radiolabeled and isotopically enriched compounds are useful as therapeutic agents, e.g., cancer and inflammation therapeutic agents, research reagents, e.g., binding assay reagents, and diagnostic agents, e.g., in vivo imaging agents. All isotopic variations of the Heteroaryl Compounds as described herein, whether radioactive or not, are intended to be encompassed within the scope of the embodiments provided herein. In some embodiments, there are provided isotopologues of the Heteroaryl Compounds, for example, the isotopologues are deuterium, carbon-13, or nitrogen-15 enriched Heteroaryl Compounds.

[0052] "Treating" as used herein, means an alleviation, in whole or in part, of symptoms associated with a disorder or disease, or slowing, or halting of further progression or worsening of those symptoms, or prevention or prophylaxis of the disease or disorder in a subject at risk for developing the disease or disorder.

[0053] The term "effective amount" in connection with an Heteroaryl Compound can mean an amount capable of alleviating, in whole or in part, symptoms associated with a disorder or disease, or slowing or halting further progression or worsening of those symptoms, or preventing or providing prophylaxis for the disease or disorder in a subject having or at risk for developing a disease disclosed herein, such as inflammatory conditions, immunological conditions, cancer, metabolic conditions or conditions treatable or preventable by inhibition of a kinase or a kinase pathway, in one embodiment, the Syk, FLT-3, JAK1 and/or JAK2 pathway. In one embodiment

an effective amount of a Heteroaryl Compound is an amount that inhibits a kinase in a cell, such as, for example, in vitro or in vivo. In some embodiments, the effective amount of the Heteroaryl Compound inhibits the kinase in a cell by 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90% or 99%, compared to the activity of the kinase in an untreated cell. The effective amount of the Heteroaryl Compound, for example in a pharmaceutical composition, may be at a level that will exercise the desired effect; for example, about 0.005 mg/kg of a subject's body weight to about 10 mg/kg of a subject's body weight in unit dosage for both oral and parenteral administration.

**[0054]** A "kinase inhibitor" within the instant context is a compound which at a concentration of 10  $\mu$ M inhibits the phosphorylating ability of the kinase enzyme by about 50% or greater than 50%, as determined by the HTRF enzyme assays as described herein. In some embodiments, the kinase is Syk kinase, in others the kinase is Syk, FLT3, JAK1, and/or JAK2.

**[0055]** "Fc Receptor" refers to a member of the family of cell surface molecules that binds the Fc portion (containing the specific constant region) of an immunoglobulin. Each Fc receptor binds immunoglobulins of a specific type. For example the Fc alpha receptor ("FcaR") binds IgA, the FceR binds IgE and the Fc $\gamma$ R binds IgG.

**[0056]** The FcaR family includes the polymeric Ig receptor involved in epithelial transport of IgA/IgM, the myeloid specific receptor RcaRI (also called CD89), the Fca/ $\mu$ R and at least two alternative IgA receptors (for a recent review see Monteiro & van de Winkel, 2003, Annu. Rev. Immunol, advanced e-publication. The FcaRI is expressed on neutrophils, eosinophils, monocytes/macrophages, dendritic cells and kupfer cells. The FcaRI includes one alpha chain and the FcR gamma homodimer that bears an activation motif (ITAM) in the cytoplasmic domain and phosphorylates Syk kinase.

**[0057]** The FceR family includes two types, designated FceRI and FceRII (also known as CD23). FceRI is a high affinity receptor found on mast, basophil and eosinophil cells that anchors monomeric IgE to the cell surface. The FceRI possesses one alpha chain, one beta chain and the gamma chain homodimer discussed above. The FceRII is a low affinity receptor expressed on mononuclear phagocytes, B lymphocytes, eosinophils and platelets. The FceRII comprises a single polypeptide chain and does not include the gamma chain homodimer.

**[0058]** The Fc $\gamma$ R family includes three types, designated Fc $\gamma$ RI (also known as CD64), Fc $\gamma$ RII (also known as CD32) and Fc $\gamma$ RIII (also known as CD16). Fc $\gamma$ RI is a high affinity

receptor found on mast, basophil, mononuclear, neutrophil, eosinophil, dendritic and phagocyte cells that anchors monomeric IgG to the cell surface. The FcγRI includes one alpha chain and the gamma chain dimer shared by FcαRI and FcεRI.

[0059] The FcγRII is a low affinity receptor expressed on neutrophils, monocytes, eosinophils, platelets and B lymphocytes. The FcγRII includes one alpha chain, and does not include the gamma chain homodimer discussed above.

[0060] The FcγRIII is a low affinity expressed on NK, eosinophil, macrophage, neutrophil and mast cells. It comprises one alpha chain and the gamma homodimer shared by FcαRI, FcεRI and FcγRI.

[0061] "Cell proliferative disorder" refers to a disorder characterized by abnormal proliferation of cells. A proliferative disorder does not imply any limitation with respect to the rate of cell growth, but merely indicates loss of normal controls that affect growth and cell division. Thus, in some embodiments, cells of a proliferative disorder can have the same cell division rates as normal cells but do not respond to signals that limit such growth. Within the ambit of "cell proliferative disorder" is neoplasm or tumor, which is an abnormal growth of tissue. Cancer refers to any of various malignant neoplasms characterized by the proliferation of cells that have the capability to invade surrounding tissue and/or metastasize to new colonization sites.

[0062] "Hematopoietic neoplasm" refers to a cell proliferative disorder arising from cells of the hematopoietic lineage. Generally, hematopoiesis is the physiological process whereby undifferentiated cells or stem cells develop into various cells found in the peripheral blood. In the initial phase of development, hematopoietic stem cells, typically found in the bone marrow, undergo a series of cell divisions to form multipotent progenitor cells that commit to two main developmental pathways: the lymphoid lineage and the myeloid lineage. The committed progenitor cells of the myeloid lineage differentiate into three major sub-branches comprised of the erythroid, megakaryocyte, and granulocyte/monocyte developmental pathways. An additional pathway leads to formation of dendritic cells, which are involved in antigen presentation. The erythroid lineage gives rise to red blood cells while the megakaryocytic lineage gives rise to blood platelets. Committed cells of the granulocyte/monocyte lineage split into granulocyte or monocyte developmental pathways, the former pathway leading to formation of

neutrophils, eosinophils, and basophils and the latter pathway giving rise to blood monocytes and macrophages.

**[0063]** “Lymphoid neoplasm” refers a proliferative disorder involving cells of the lymphoid lineage of hematopoiesis. Lymphoid neoplasms can arise from hematopoietic stem cells as well as lymphoid committed progenitor cells, precursor cells, and terminally differentiated cells. These neoplasms can be subdivided based on the phenotypic attributes of the aberrant cells or the differentiated state from which the abnormal cells arise. Subdivisions include, among others, B cell neoplasms, T cell neoplasms, NK cell neoplasms, and Hodgkin's lymphoma.

**[0064]** “Myeloid neoplasm” refers to proliferative disorder of cells of the myeloid lineage of hematopoiesis. Neoplasms can arise from hematopoietic stem cells, myeloid committed progenitor cells, precursor cells, and terminally differentiated cells. Myeloid neoplasms can be subdivided based on the phenotypic attributes of the aberrant cells or the differentiated state from which the abnormal cells arise. Subdivisions include, among others, myeloproliferative diseases, myelodysplastic/myeloproliferative diseases, myelodysplastic syndromes, acute myeloid leukemia, and acute biphenotypic leukemia.

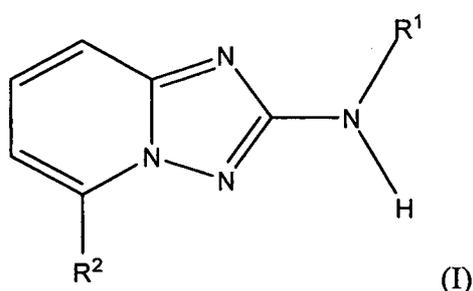

**[0065]** “Virally mediated tumor” refers to a neoplasm or tumor associated with viral infection or an activity of a virally encoded product. The neoplasm can arise from presence of a latent virus integrated into the cellular genome or arise from activity of a virally associated gene product. Infection with the virus need not be tightly correlated in time with tumor formation in that incubation periods can extend from months to years before development of a tumor phenotype. Because in some embodiments, the treatments herein are directed to the use of Syk inhibitory Heteroaryl Compounds, the applicable virally associated tumors are those in which viral modulation of Syk activity is correlated with aberrant cell proliferation. Any virus, including RNA and DNA viruses and viruses that reside episomally or integrate into the cellular genome, in which activation of Syk is a consequence of virus infection can be targeted using the methods herein.

**[0066]** “Tumor metastasis” refers to the capability of tumor cells to migrate from the original tumor site and colonize in other tissues. Tumors formed from cells that have spread are referred to as "secondary tumors" and contain cells that are similar to those in the original "primary" tumor. Metastatic tumors typically form by migration of tumor cells from the original tumor site through the blood and lymph system to other tissues.

[0067] The terms “patient” and “subject” include an animal, including, but not limited to, an animal such as a cow, monkey, horse, sheep, pig, chicken, turkey, quail, cat, dog, mouse, rat, rabbit or guinea pig. In one embodiment the subject is a mammal, in another a human. In certain embodiments, a patient or subject “in need thereof” is a patient or subject having a certain disease or disorder or at risk for having a disease or disorder.

#### 4.3 METHODS FOR MAKING HETEROARYL COMPOUNDS

[0087] The Heteroaryl Compounds can be made by one skilled in the art using conventional organic syntheses and commercially available materials. By way of example and not limitation, Heteroaryl Compounds can be prepared as outlined in Schemes 1-12 shown below, as well as in

the examples set forth in Section 5.1. It should be noted that one skilled in the art can modify the procedures set forth in the illustrative schemes and examples to arrive at the desired product.

[0088] **Scheme 1**

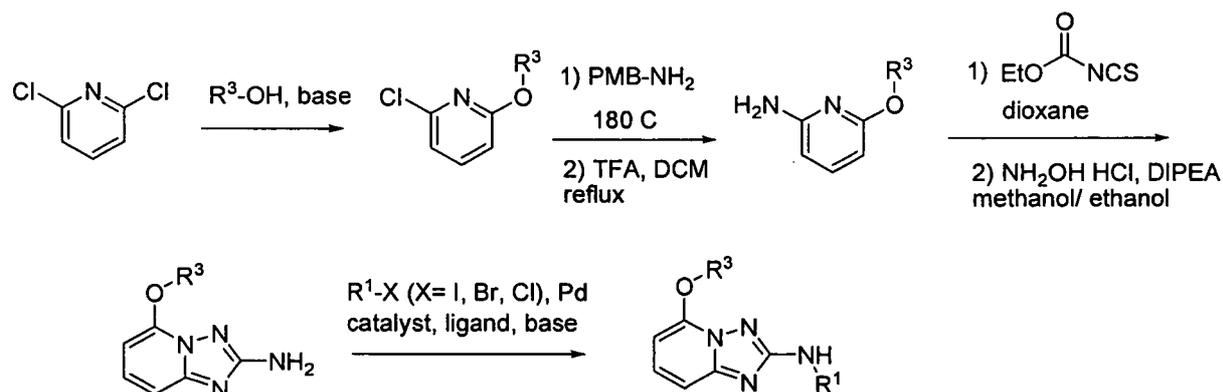

[0089] Heteroaryl Compounds can be synthesized from compound I, by treatment with an appropriate boronic acid or boronate ester in the presence of a palladium catalyst (such as palladium acetate), ligand (such as triphenylphosphine or tricyclohexylphosphine) and base (such as potassium phosphate or cesium fluoride) to introduce the  $R^2$  substituent (see compound II). The resulting compound can then be reacted with an appropriate halo-compound in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium (0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino) 1,1'-binaphthyl) and base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide) to introduce the  $R^1$  substituent.

[0090] Alternatively, compound II can be reacted with sodium nitrite in hydrobromic acid to obtain compound III, which can then be reacted with an appropriate amine, in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium (0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino) and base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide).

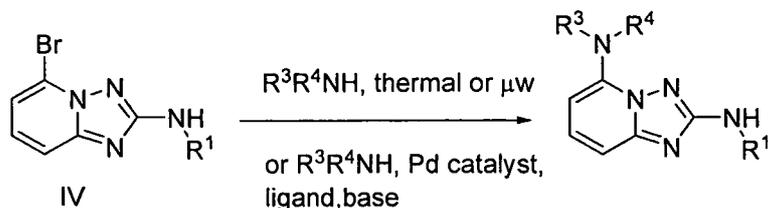

[0091] Alternatively, the R<sup>1</sup> substituent can be introduced first via coupling of compound I with an appropriate boronic acid or boronate ester in the presence of a copper catalyst (such as copper acetate (II)) and ligand (such as bipyridine), or by reaction with an appropriate halo-compound in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium (0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino) and base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide). Compound IV can then be reacted with an appropriate boronic acid, boronate ester, or potassium trifluoroborate in the presence of a palladium catalyst (such as such as 1-1'-bis(diphenylphosphino) ferrocene palladium dichloride or tetrakis(triphenylphosphine)palladium (0) or palladium diacetate) and base (such as sodium or potassium carbonate, potassium phosphate or potassium acetate) to introduce the R<sup>2</sup> substituent.

[0092] **Scheme 2**

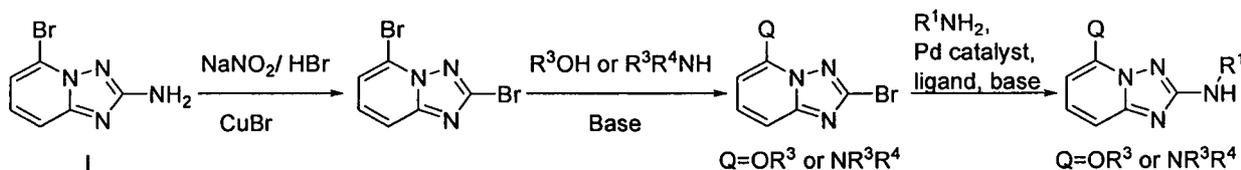

[0093] Compounds wherein R<sup>2</sup> = OR<sup>3</sup> can be prepared as shown in Scheme 2.

2,6-Dichloropyridine is reacted with an appropriately substituted alcohol in the presence of a base (such as sodium hydroxide or sodium metal) and the second chlorine atom can be converted to an amino group via treatment with *para*-methoxybenzylamine and subsequent deprotection with an acid, such as trifluoroacetic acid. The resulting compound can be treated sequentially with ethoxycarbonyl isothiocyanate in dioxane and hydroxylamine to obtain the cyclized compound, which can then be reacted with an appropriate halo-compound in the presence of a palladium catalyst (such as tris(dibenzylideneacetone) dipalladium (0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino) 1,1'-binaphthyl) and base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide) to introduce the R<sup>1</sup> substituent.

**[0094] Scheme 3**

[0095] Compounds wherein  $R^2 = NR^3R^4$  can be prepared as shown in Scheme 3. Compound IV can be reacted with a secondary amine under thermal conditions, microwave irradiation or by reacting with a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium (0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino)1,1'-binaphthyl)) and base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide).

**[0096] Scheme 4**

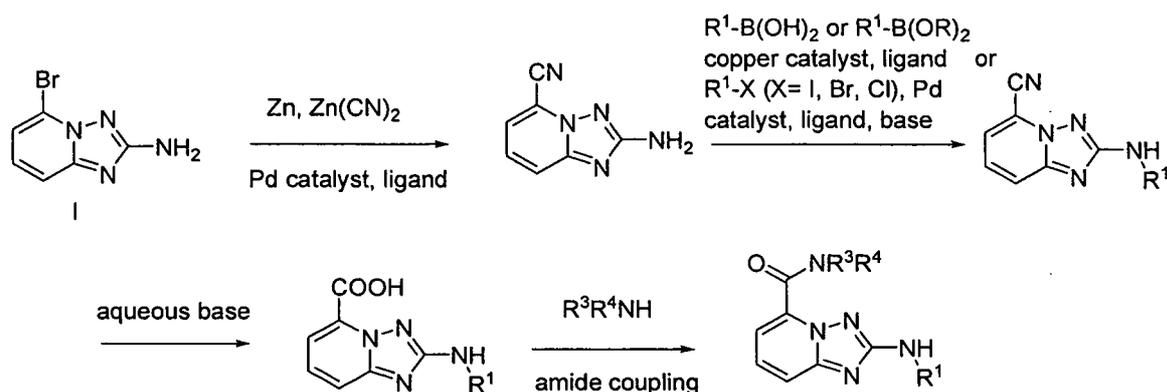

[0097] Compounds wherein  $R^2$  is  $-OR^3$  or  $-NR^3R^4$  (wherein  $R^4$  can be H) can be prepared as shown in Scheme 4. Compound I can be reacted with sodium nitrite and hydrogen hydrobromide in the presence of copper (I) bromide. The resulting dibromo compound can then be treated with an appropriate alcohol or amine in the presence of a base, such as sodium hydride or *N,N*-diisopropylethylamine. The  $R^1$  substituent can then be installed by reaction with an appropriate amine in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium (0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino)1,1'-binaphthyl) and base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide).

**[0098] Scheme 5**

[0099] Compounds wherein  $R^2 = \text{NHC(O)R}^3$  can be prepared as shown in Scheme 5.

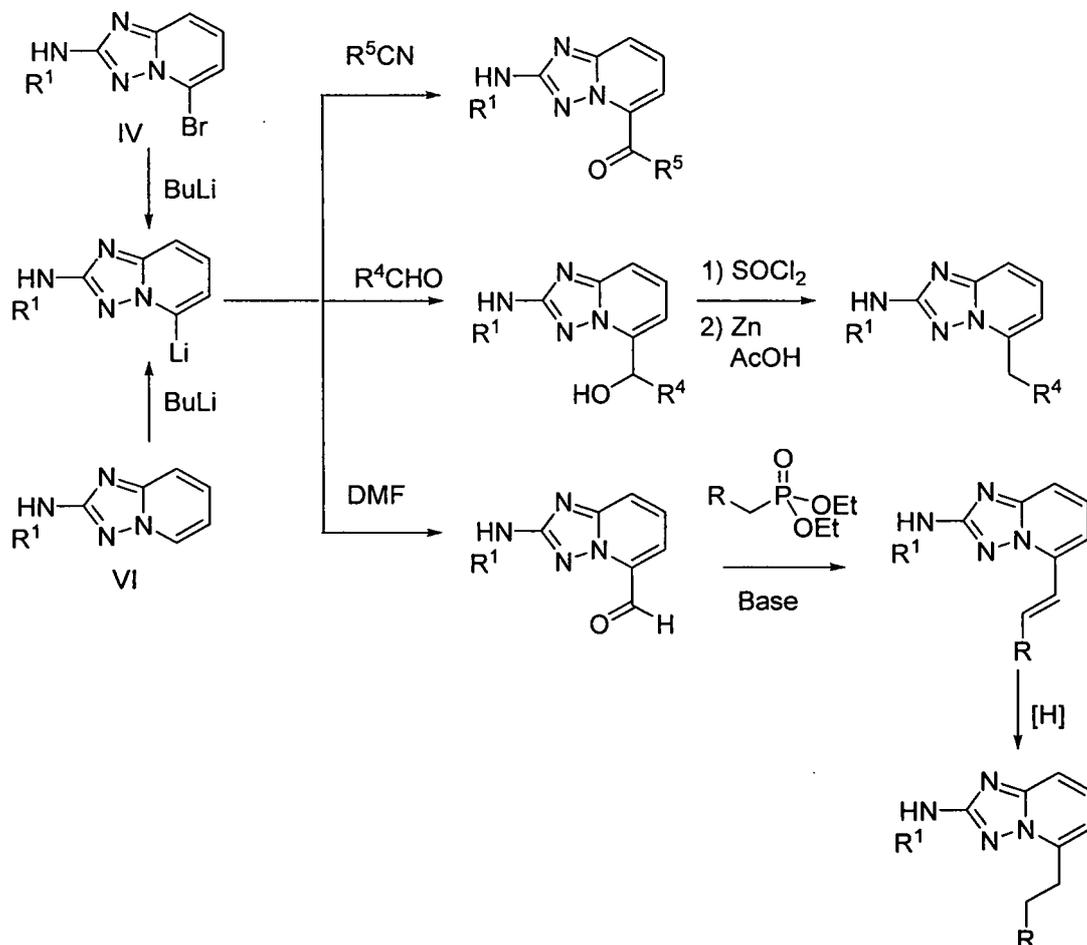

Compound IV can be reacted with ammonia and copper iodide to introduce the amino group that can then be reacted with an appropriate acetyl chloride in the presence of a base such as triethylamine.

[00100] **Scheme 6**

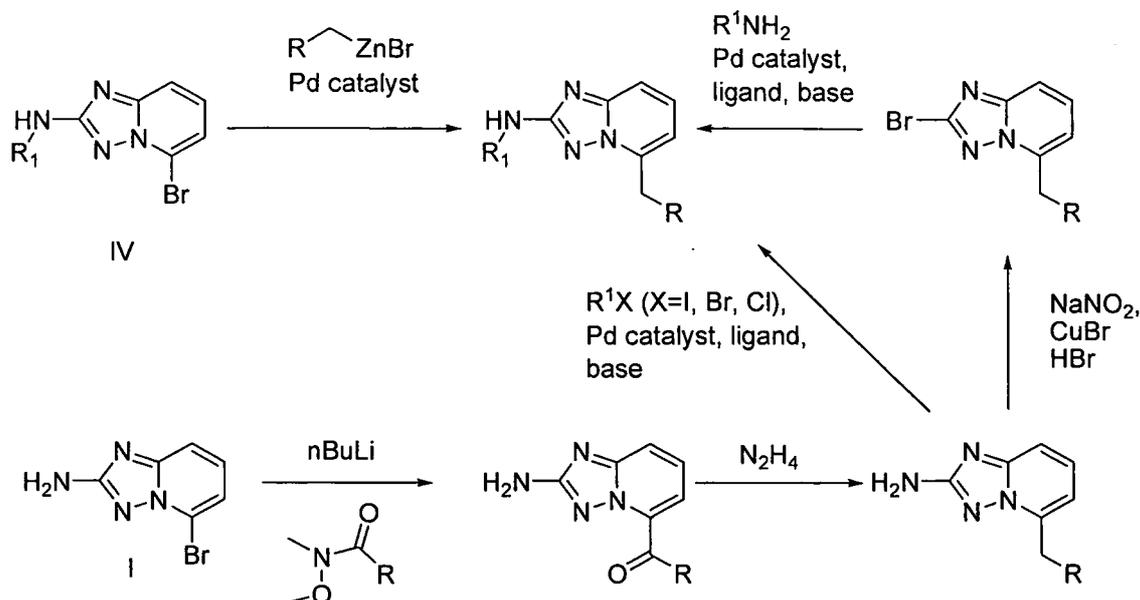

[00101] Compounds wherein  $R^2 = \text{C(O)NR}^3\text{R}^4$  can be prepared as shown in Scheme 6.

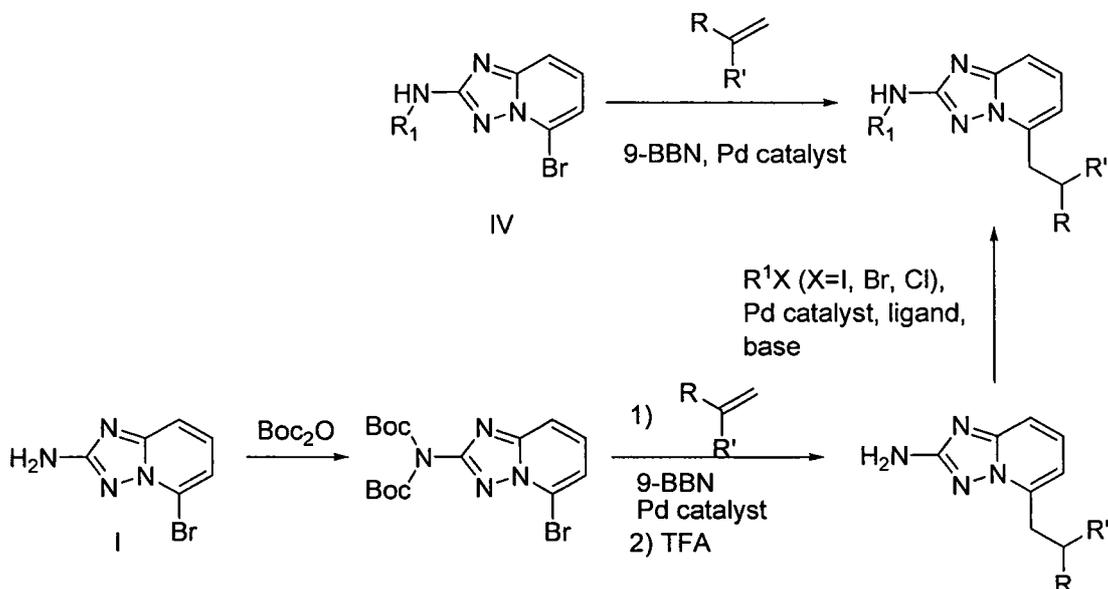

Compound I can be reacted with zinc dust and zinc cyanide in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium(0)) and a ligand (such as 1,1'-bis(diphenylphosphino)ferrocene). The resulting compound can then be treated with an appropriate boronic acid or boronate ester in the presence of a copper catalyst (such as copper acetate (II)) and ligand (such as bipyridine) or by reaction with an appropriate halo-compound in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium (0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino)1,1'-binaphthyl)) and base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide). The cyano group is then hydrolyzed with base (such sodium hydroxide) and the resulting acid is reacted with an appropriate amine under standard amide coupling conditions.

[00102] **Scheme 7**

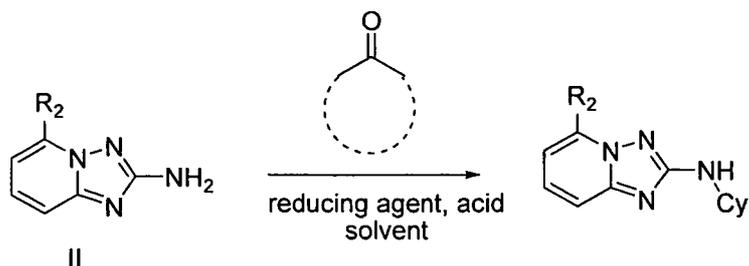

[00103] Compounds wherein  $R^2 = C(O)R^5$ ,  $CH(OH)R^4$  or a substituted or unsubstituted alkyl can be prepared as shown in Schemes 7, 8, 9 and/or 11. Compound IV can be reacted with butyllithium to generate the lithiated intermediate that can then be reacted with an appropriate nitrile or aldehyde. When it is reacted with an aldehyde, the resulting alcohol can be reduced with thionyl chloride and zinc dust. Alternatively, the lithium species can be reacted with *N,N*-dimethylformamide to generate an aldehyde that can then be reacted with an appropriate ylide (obtained from a phosphonate and a base such as aqueous sodium hydroxide). The double bond can then be reduced via catalytic hydrogenation using a catalyst such as palladium on carbon under hydrogen.

Alternatively, compound I can be reacted with *n*-butyllithium and condensed with an appropriate Weinreb amide. The resulting ketone can then be reduced with a reducing agent such as hydrazine. The  $\text{R}^1$  substituent can be introduced by coupling with an appropriate halo-compound in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium (0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino)1,1'-binaphthyl) and base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide) or by converting the amine to the bromo compound via treatment with sodium nitrite and copper(I) bromide in hydrobromic acid and then coupling with an appropriate amine in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium (0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino)1,1'-binaphthyl) and base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide).

Alternatively, compound I can be reacted with di-*tert*-butyl dicarbonate and then treated with an appropriate alkene in the presence of a borane (such as (1*S*,5*S*)-9-borabicyclo[3.3.1]nonane), a palladium catalyst (such as [1,1'-bis(diphenylphosphino)ferrocene]dichloropalladium(II) complex with dichloromethane) and a base such as potassium carbonate. The  $\text{R}^1$  substituent can then be introduced by reaction with an appropriate halo-compound in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium (0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino)1,1'-binaphthyl) and base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide).

Compound II can be reacted with an appropriately substituted cyclic ketone in the presence of a reducing agent such as sodium triacetoxyborohydride in the presence of acid (such as acetic acid).

**[00110] Scheme 11**

[00111] Compounds wherein R<sup>2</sup> is -(CH<sub>2</sub>)CR<sup>6</sup>(OR<sup>3</sup>)R<sup>4</sup> or alkyl can be prepared as shown in Scheme 11. 6-Methylpyridin-2-amine can be reacted sequentially with ethoxycarbonyl isothiocyanate and hydroxylamine in the presence of *N,N*-diisopropylethylamine. The cyclized compound can then be reacted with an appropriate halo-compound in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium (0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino)1,1'-binaphthyl) and base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide). The lithiated intermediate can then be generated by treatment with butyllithium and can be reacted with an appropriate aldehyde or ketone. When a ketone is used, the resulting tertiary alcohol can be treated with acid (such as *p*-toluenesulfonic acid) to form the corresponding alkene that can then be reduced to the corresponding alkane via catalytic hydrogenation.

## [00112] Scheme 12

[00113] Compounds wherein R<sup>2</sup> is  $-(CH_2)-NR^6R^7$  can be synthesized as shown in Scheme 12. Compound VII can be reacted with *N*-bromosuccinimide and 2,2'-azobis(2-methylpropionitrile), followed by reaction with the appropriate amine in the presence of a base, such as potassium carbonate. The R<sup>1</sup> substituent can be introduced by coupling with an appropriate halo-compound in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium(0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino)1,1'-binaphthyl) and a base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide). Alternatively, compound VIII can be reduced to the alcohol with a reducing agent such as sodium borohydride or sodium triacetoxyborohydride, and subsequently converted to a leaving group such as bromide or mesylate via treatment with phosphorus tribromide, methanesulfonyl chloride or methanesulfonic anhydride. The resulting compound can be reacted with the appropriate amine in the presence of base such as potassium

Alternatively, these compounds can be obtained in one step from compound VIII by reaction with an appropriate amine in the presence of a reducing agent such as sodium triacetoxyborohydride. Alternatively, 2,5-dibromo-[1,2,4]triazolo[1,5-*a*]pyridine can be treated with *n*-butyllithium, followed by *N,N*-dimethylformamide. The resulting aldehyde can then be reacted with a reducing agent such as sodium borohydride to yield the corresponding alcohol, which in turn is treated with methanesulfonic anhydride and an appropriate amine. The R<sup>1</sup> group can be installed by reaction with an appropriate amino-compound in the presence of a palladium catalyst (such as tris(dibenzylideneacetone)dipalladium(0)), ligand (such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene or (*R*)-(+)-2,2'-bis(diphenylphosphino)1,1'-binaphthyl) and a base (such as cesium carbonate, sodium *tert*-butoxide or potassium *tert*-butoxide).

**[00114]** Pharmaceutically acceptable salts of the Heteroaryl Compounds can be formed by conventional and known techniques, such as by reacting a Heteroaryl Compound with a suitable acid as disclosed above. Such salts are typically formed in high yields at moderate temperatures, and often are prepared by merely isolating the compound from a suitable acidic wash in the final step of the synthesis. The salt-forming acid may be dissolved in an appropriate organic solvent, or aqueous organic solvent, such as an alkanol, ketone or ester. On the other hand, if the Heteroaryl Compound is desired in the free base form, it may be isolated from a basic final wash step, according to known techniques. For example, a typical technique for preparing hydrochloride salt is to dissolve the free base in a suitable solvent, and dry the solution thoroughly, as over molecular sieves, before bubbling hydrogen chloride gas through it.

[00129] In another embodiment, provided herein are methods for the treatment or prevention of diseases associated with thrombotic events such as but not limited to atherosclerosis, myocardial infarction and ischemic stroke.

[00130] Provided also are methods that permit the regulation of, and in particular the inhibition of, downstream processes that result as a consequence of activating the Fc receptor signaling cascade(s). Such downstream processes include, but are not limited to, FcεRI-mediated and/or FcγRI-mediated degranulation, cytokine production and/or the production and/or release of lipid mediators such as leukotrienes and prostaglandins. The method generally involves contacting a cell expressing an Fc receptor, such as one of the cell types discussed above, with an amount of a Heteroaryl Compound as described herein, effective to regulate or inhibit the Fc receptor signaling cascade and/or a downstream process effected by the activation of this signaling cascade. The method may be practiced in *in vitro* contexts or in *in vivo* contexts as a therapeutic approach towards the treatment or prevention of diseases characterized by, caused by or associated with the Fc receptor signaling cascade, such as diseases effected by the release of granule specific chemical mediators upon degranulation, the release and/or synthesis of cytokines and/or the release and/or synthesis of lipid mediators such as leukotrienes and prostaglandins.

[00131] In yet another aspect, there are also provided methods for the treatment or prevention of diseases characterized by, caused by or associated with the release of chemical mediators as a consequence of activating Fc receptor signaling cascades, such as FcεRI and/or FcγRI-signaling cascades. The methods generally involve administering to a subject an amount of a Heteroaryl Compound, effective to treat or prevent the disease. As discussed previously, activation of the FcεRI or FcγRI receptor signaling cascade in certain immune cells leads to the release and/or synthesis of a variety of chemical substances that are pharmacological mediators of a wide

variety of diseases. Any of these diseases may be treated or prevented according to the methods as described herein.

**[00132]** For example, in mast cells and basophil cells, activation of the FcεRI or FcγRI signaling cascade leads to the immediate (i.e., within 1-3 min. of receptor activation) release of preformed mediators of atopic and/or Type I hypersensitivity reactions (e.g., histamine, proteases such as tryptase, etc.) via the degranulation process. Such atopic or Type I hypersensitivity reactions include, but are not limited to, anaphylactic reactions to environmental and other allergens (e.g., pollens, insect and/or animal venoms, foods, drugs, contrast dyes, etc.), anaphylactoid reactions, hay fever, allergic conjunctivitis, allergic rhinitis, allergic asthma, atopic dermatitis, eczema, urticaria, mucosal disorders, tissue disorders and certain gastrointestinal disorders. The immediate release of the preformed mediators via degranulation is followed by the release and/or synthesis of a variety of other chemical mediators, including, among other things, platelet activating factor (PAF), prostaglandins and leukotrienes (e.g., LTC<sub>4</sub>) and the de novo synthesis and release of cytokines such as TNFα, IL-4, IL-5, IL-6, IL-13, etc. The first of these two processes occurs approximately 3-30 min. following receptor activation; the latter approximately 30 min.-7 hrs. following receptor activation. These “late stage” mediators are thought to be in part responsible for the chronic symptoms of the above-listed atopic and Type I hypersensitivity reactions, and in addition are chemical mediators of inflammation and inflammatory diseases (e.g., osteoarthritis, inflammatory bowel disease, ulcerative colitis, Crohn’s disease, idiopathic inflammatory bowel disease, irritable bowel syndrome, spastic colon, etc.), low grade scarring (e.g., scleroderma, increased fibrosis, keloids, post-surgical scars, pulmonary fibrosis, vascular spasms, migraine, reperfusion injury and post myocardial infarction), and sicca complex or syndrome. All of these diseases may be treated or prevented according to the methods as described herein.

**[00133]** Additional diseases which can be treated or prevented according to the methods as described herein include diseases associated with basophil cell and/or mast cell pathology. Examples of such diseases include, but are not limited to, diseases of the skin such as scleroderma, cardiac diseases such as post myocardial infarction, pulmonary diseases such as pulmonary muscle changes or remodeling, chronic obstructive pulmonary disease (COPD) and diseases of the gut such as inflammatory bowel syndrome (spastic colon).

[00134] The Heteroaryl compounds as described herein are also potent inhibitors of the tyrosine kinase Syk kinase. Thus, in still another aspect, there are provided methods of regulating, and in particular inhibiting, Syk kinase activity. The method generally involves contacting a Syk kinase or a cell comprising a Syk kinase with an amount of a Heteroaryl Compound, effective to regulate or inhibit Syk kinase activity. In one embodiment, the Syk kinase is an isolated or recombinant Syk kinase. In another embodiment, the Syk kinase is an endogenous or recombinant Syk kinase expressed by a cell, for example a mast cell or a basophil cell. The method may be practiced in in vitro contexts or in in vivo contexts as a therapeutic approach towards the treatment or prevention of diseases characterized by, caused by or associated with Syk kinase activity.

[00135] In one embodiment, provided herein are methods of inhibiting a Syk kinase in a cell expressing said Syk kinase, comprising contacting said cell with an effective amount of a Heteroaryl Compound, wherein the compound is not *cis*-4-(2-(phenylamino)-[1,2,4]triazolo[1,5-a]pyridin-5-ylamino) cyclohexanecarboxamide.

[00136] Syk kinase is known to play a critical role in other signaling cascades. For example, Syk kinase is an effector of B-cell receptor (BCR) signaling (Turner *et al.*, *Immunology Today* 21:148-154 (2000) and is an essential component of integrin beta(1), beta(2) and beta(3) signaling in neutrophils (Mocsai *et al.*, *Immunity* 16:547-558 (2002)). As the Heteroaryl compounds described herein are potent inhibitors of Syk kinase, they can be used to regulate, and in particular inhibit, any signaling cascade where Syk plays a role, such as, for example, the Fc receptor, BCR and integrin signaling cascades, as well as the cellular responses elicited through these signaling cascades. The particular cellular response regulated or inhibited will depend, in part, on the specific cell type and receptor signaling cascade, as is well known in the art. Non-limiting examples of cellular responses that may be regulated or inhibited with the Heteroaryl compounds include a respiratory burst, cellular adhesion, cellular degranulation, cell spreading, cell migration, phagocytosis (e.g., in macrophages), calcium ion flux (e.g., in mast, basophil, neutrophil, eosinophil and B-cells), platelet aggregation, and cell maturation (e.g., in B-cells).

[00137] Thus, in another aspect, there are provided methods of regulating, and in particular inhibiting, signal transduction cascades in which Syk plays a role. The method generally involves contacting a Syk-dependent receptor or a cell expressing a Syk-dependent receptor with

an amount of a Heteroaryl Compound as described herein, effective to regulate or inhibit the signal transduction cascade. The methods may also be used to regulate, and in particular inhibit, downstream processes or cellular responses elicited by activation of the particular Syk-dependent signal transduction cascade. The methods may be practiced to regulate any signal transduction cascade where Syk is not known or later discovered to play a role. The methods may be practiced in in vitro contexts or in in vivo contexts as a therapeutic approach towards the treatment or prevention of diseases characterized by, caused by or associated with activation of the Syk-dependent signal transduction cascade. Non-limited examples of such diseases include those previously discussed.

**[00138]** These include various tumors and cancers, benign or malignant, metastatic or non-metastatic. Specific properties of cancers, such as tissue invasiveness or metastasis, can be targeted using the methods described herein. **[00139]** In some embodiments, the cell proliferative disorder treated is a hematopoietic neoplasm, which is aberrant growth of cells of the hematopoietic system.

**[00140]** In some embodiments, the hematopoietic neoplasm treated is a lymphoid neoplasm, where the abnormal cells are derived from and/or display the characteristic phenotype of cells of the lymphoid lineage. Lymphoid neoplasms can be subdivided into B-cell neoplasms, T and NK-cell neoplasms, Hodgkin's lymphoma and non-Hodgkin's lymphoma. In various embodiments, any of the lymphoid neoplasms that are associated with aberrant Syk activity can be treated with the Heteroaryl Compounds.

**[00141]** In some embodiments, the hematopoietic neoplasm treated is a myeloid neoplasm. Myeloid neoplasms can be subdivided into myeloproliferative diseases, myelodysplastic/myeloproliferative diseases, myelodysplastic syndromes, and acute myeloid leukemias. Exemplary myeloproliferative diseases are chronic myelogenous leukemia (e.g., Philadelphia chromosome positive (t(9;22)(qq34;q11)), chronic neutrophilic leukemia, chronic eosinophilic leukemia/hypereosinophilic syndromes, chronic idiopathic myelofibrosis,

In various embodiments, any of the myeloid neoplasms that are associated with aberrant Syk activity can be treated with the Heteroaryl Compounds as described herein.

**[00142]** In some embodiments, the Heteroaryl Compounds can be used to treat Acute myeloid leukemias (AML), which represent a large class of myeloid neoplasms having its own subdivision of disorders. These subdivisions include, among others, AMLs with recurrent cytogenetic translocations, AML with multilineage dysplasia, and other AML not otherwise categorized. **[00143]** In some embodiments, the Heteroaryl Compounds can be used to treat bone and connective tissue sarcomas such as but not limited to bone sarcoma, osteosarcoma, chondrosarcoma, Ewing's sarcoma, malignant giant cell tumor, fibrosarcoma of bone, chordoma, periosteal sarcoma, soft-tissue sarcomas, angiosarcoma (hemangiosarcoma), fibrosarcoma, Kaposi's sarcoma, leiomyosarcoma, liposarcoma, lymphangiosarcoma, metastatic cancers,

**[00144]** In other aspects, cell proliferative disorders that can be targeted with the Heteroaryl Compounds comprise virally mediated tumors. These can arise from infection of cells by an oncogenic virus that has the capability of transforming a normal cell into a tumor cell. In some embodiments, the virally mediated tumor treatable with the compounds disclosed herein is associated with any virus that encodes an immunoreceptor tyrosine –based activation motif (ITAM) capable of modulating Syk activity. This motif refers to a conserved amino acid sequence motif that functions by interacting with and activating nonreceptor tyrosine kinases. ITAM motifs are found in, among others, the  $\beta$  and  $\gamma$  chains of Fc $\epsilon$ RI, the  $\epsilon$  subunit of the T cell receptor, and immunoglobulin  $\beta$  (Ig $\beta$ ) and Ig $\alpha$  of the B cell receptor. The canonical sequence motif is typically Yxx(L/I)<sub>x6-8</sub>Yxx(L/I), where x represents any amino acid. Generally, the tyrosine residues in the motif are involved in ITAM signaling and are substrates for phosphorylation by Src family of kinases. The phosphorylated form of ITAMs function as interaction sites for SH2 (src homology domain) containing signaling proteins, such as Syk/ZAP-70 kinases. In addition to its presence in a variety of cellular cell surface molecules, the ITAM sequences have been identified in virally encoded proteins. In view of the descriptions herein indicating function of Syk kinase as an oncogene, tumors associated with viruses carrying genes encoding proteins with ITAM sequences can be treated with the Heteroaryl Compounds.

**[00145]** Accordingly, in some embodiments, the virally mediated tumor treatable with the Heteroaryl Compounds is associated with Kaposi's sarcoma (KS) associated herpes virus, a lymphotropic virus implicated in Kaposi's sarcoma, a rare malignancy found at higher incidence among HIV infected population. In some embodiments, the virally mediated tumor is associated with Epstein Barr Virus (EBV).

**[00146]** In some embodiments, the virally mediated tumor to be treated with the Heteroaryl Compound is associated with Human T-cell Lymphotropic Virus (HTLV-I virus), a retrovirus in the same class of virus as the AIDS virus, HIV-I.

[00147] In some embodiments, the virally mediated tumor is associated with mammary tumor virus (MTV). ITAM sequences are found within the Env gene of murine mammary tumor virus (MMTV), a B type retrovirus identified as an etiological agent for breast cancer in mice.

[00148] It is to be understood that use of Heteroaryl Compounds for treating virally mediated tumors is not limited to tumors associated with the viruses specified above. As noted, any tumors associated with an oncogenic virus in which Syk is activated as part of its oncogenic mechanism, whether or not it involves ITAM sequences, can be targeted using the Heteroaryl Compounds.

[00149] In other aspects, the present disclosure is directed to the treatment of tumor metastasis by use of the Heteroaryl Compounds. Metastasis is a characteristic of malignant tumor cells whereby tumor cells detach from its site of origin and then spread to colonize at other sites. These secondary tumors can form in tissues unrelated to the cells from which the tumor cells originate. It is the formation of these secondary tumors by metastasis that appears to be the primary cause of mortality from malignant forms of cancer. Metastasis begins when malignant cells break off from the primary tumor and enter the blood or lymphatic system, and then migrate to other colonization sites. Generally, normal cells do not detach and invade other tissues because of various signals that inhibit dissimilar cells from adhering to each other, as well as signals between cells that inhibit cell growth. Cell transformation, however, alters these normal regulatory programs such that tumor cells interact with local tissue cells to modify the local extracellular matrix, stimulate migration, and promote proliferation and survival. Alterations of cell adhesion molecule (CAMs), such as those members of the immunoglobulin and calcium-dependent cadherin families and integrins, appear to play critical role in invasion and metastasis. For instance, alteration of N-CAM from a highly adhesive isoform to a poorly adhesive form, which along with its down regulation, may lead to invasive pancreatic cancer.

[00150] Syk kinase activity is associated with various integrins expressed on cells of the hematopoietic lineage, but also in non-hematopoietic cells. Syk kinase is implicated in  $\beta 1$  integrin signaling of lung epithelial cells (Ulanova *et al.*, *Am. J. Physiol. Lung Cell Mol. Physiol.* 288:L497-L507 (2004) and monocytes (Lin *et al.*, *Biol. Chem.* 270(27):16189-97 (1995),  $\beta 2$  integrin signaling in granulocytes/neutrophils (Miura *et al.*, *Blood* 96(5): 1733-9 (2000); Kusumoto *et al.*, *Microbiol. Immunol.* 45(3):241-8 (2001), and  $\beta 3$  integrin signaling in platelet activation and cell adhesion (Gao *et al.*, *EMBO J.* 16(21):6414-25 (1997). Given the connection provided herein between Syk kinase activity and tumorigenesis, the use of the Syk-inhibitory

Heteroaryl Compounds in attenuating the invasiveness and metastatic properties of tumors is indicated through the link between Syk kinase activity and certain integrins (Mocsai *et al.*, *Immunity* 16(4):547-58 (2002). Thus, in some embodiments, the Heteroaryl Compounds can be used to modulate metastatic properties of tumors mediated via integrin activity. In some embodiments, the Heteroaryl Compounds can be used to attenuate tumor cell tissue invasiveness and metastatic potential affected by  $\beta 1$  integrins (Lin *et al.*, *Biol. Chem.* 270:16189-16197 (1995); Kusumoto *et al.*, *Microbiol Immunol.*, 45(3):241-8 (2001); Ortiz-Stern *et al.*, *J Leukoc Biol.* 77(5):787-99 (2005). An exemplary integrin of this type is integrin  $\alpha 2\beta 1$ .

**[00151]** In some embodiments, the Heteroaryl Compounds can be used to attenuate tumor cell tissue invasiveness and metastatic potential affected by the activity of  $\beta 2$  integrins (CD 18) (Willeke *et al.*, *J. Leukoc. Biol.* 74(2):260-9 (2003). These include, among others, CD1 la/CD18, CD1 lb/CD18, CD1 lc/CD18, and CD1ld/CD18. In further embodiments, the Heteroaryl Compounds can be used to attenuate tumor cell tissue invasiveness and metastatic potential affected by the activity of  $\beta 3$  integrins. Exemplary integrins of this type are  $\alpha_{Iib}\beta 3$  and  $\alpha_v\beta 3$ .

**[00152]** Various tumor types capable of metastasis can be treated with the Heteroaryl Compounds. Such tumors include, by way of example and not limitation, breast cancer, ovarian cancer, renal cancer, gastrointestinal cancer, kidney cancer, bladder cancer, pancreatic cancer, lung squamous carcinoma, and adenocarcinoma (see, e.g., Felding-Habermann *et al.*, *Proc Natl Acad Sci USA* 98(4): 1853-8 (2001). Therapeutic treatment to attenuate the metastasis of established tumors can follow a diagnosis of metastasis. If no diagnosis of metastasis has been made, the Heteroaryl Compound can be administered prophylactically to reduce the probability of metastasis.

**[00153]** In another embodiment, the methods and compositions provided herein are also useful for administration to subjects in need of a bone marrow transplant to treat a malignant disease (e.g., subjects suffering from acute lymphocytic leukemia, acute myelogenous leukemia, chronic myelogenous leukemia, chronic lymphocytic leukemia, myelodysplastic syndrome ("preleukemia"), monosomy 7 syndrome, non-Hodgkin's lymphoma, neuroblastoma, brain tumors, multiple myeloma, testicular germ cell tumors, breast cancer, lung cancer, ovarian cancer, melanoma, glioma, sarcoma or other solid tumors), those in need of a bone marrow transplant to treat a non-malignant disease (e.g., subjects suffering from hematologic disorders, congenital immunodeficiencies, mucopolysaccharidoses, lipidoses, osteoporosis, Langerhan's cell

histiocytosis, Lesch-Nyhan syndrome or glycogen storage diseases), those undergoing chemotherapy or radiation therapy, those preparing to undergo chemotherapy or radiation therapy and those who have previously undergone chemotherapy or radiation therapy.

**[00154]** In another embodiment, provided herein are methods for the treatment of cancer or tumors resistant to other kinase inhibitors such as imatinib mesylate (STI-571 or Gleevec<sup>TM</sup>) treatment, comprising administering to a subject in need thereof an effective amount of a Heteroaryl Compound or a composition thereof. In a particular embodiment, provided herein are methods for the treatment of leukemias, including, but not limited to, gastrointestinal stromal tumor (GIST), acute lymphocytic leukemia or chronic myelocytic leukemia resistant to imatinib mesylate (STI-571 or Gleevec<sup>TM</sup>) treatment, comprising administering to a subject in need thereof an effective amount of a Heteroaryl Compound or a composition thereof.

**[00155]** In a specific embodiment, provided herein are methods for treating or preventing leukemia (*i.e.*, malignant neoplasms of the blood-forming tissues) including, but not limited to, chronic lymphocytic leukemia, chronic myelocytic leukemia, acute lymphoblastic leukemia, acute myelogenous leukemia and acute myeloblastic leukemia. The leukemia can be relapsed, refractory or resistant to conventional therapy. The term "relapsed" refers to a situation where subjects who have had a remission of leukemia after therapy have a return of leukemia cells in the marrow and a decrease in normal blood cells. The term "refractory or resistant" refers to a circumstance where subjects, even after intensive treatment, have residual leukemia cells in their marrow.

**[00156]** Further provide herein are methods for treating subjects who have been previously treated for cancer, but are non-responsive to standard therapies, as well as those who have not previously been treated. Also provided herein are methods for treating subjects regardless of subject's age, although some cancers are more common in certain age groups. Still further provided herein are methods for treating subjects who have undergone surgery in an attempt to treat the cancer at issue, as well as those who have not. Because subjects with cancer have heterogenous clinical manifestations and varying clinical outcomes, the treatment given to a subject may vary, depending on his/her prognosis. The skilled clinician will be able to readily determine without undue experimentation specific secondary agents, types of surgery, and types of non-drug based standard therapy that can be effectively used to treat an individual subject with cancer.

[00157] It is to be understood that the Heteroaryl Compounds can be used independently of any other treatment, or used in combination with other cancer treatment regimens, including surgery, radiology, or other chemotherapies. A Heteroaryl Compound can be combined with other pharmacologically active compounds (“second active agents”) in methods and compositions described herein. It is believed that certain combinations may work synergistically in the treatment of particular types diseases or disorders, and conditions and symptoms associated with such diseases or disorders. A Heteroaryl Compound can also work to alleviate adverse effects associated with certain second active agents, and vice versa.

[00158] Accordingly, in some embodiments, the Heteroaryl Compounds can be used in combination with other chemotherapeutic agents. Combination treatments with the Heteroaryl Compounds can target different cellular components by appropriate choice of the second chemotherapeutic agent. For instance, the Heteroaryl Compounds can be used in some embodiments to limit the metastatic potential of tumor cells while another chemotherapeutic agent can be used to eliminate or kill aberrant cells.

[00159] Various chemotherapeutic agents can be used in combination with the Heteroaryl Compounds to treat cell proliferative disorders. These chemotherapeutic agents can be general cytotoxic agents or target a specific cellular molecule. Various classes of cancer chemotherapeutic agents include, among others, antimetabolites, agents that react with DNA {e.g., alkylating agents, coordination compounds, etc.}, inhibitors of transcription enzymes, topoisomerase inhibitors, DNA minor-groove binding compounds, antimitotic agents {e.g., vinca alkyloids}, antitumor antibiotics, hormones, and enzymes. Exemplary alkylating agents include, by way of example and not limitation, mechlorothamine, cyclophosphamide, ifosfamide, melphalan, chlorambucil, ethyleneimines, methylmelamines, alkyl sulfonates {e.g., busulfan}, and carmustine. Exemplary antimetabolites include, by way of example and not limitation, folic acid analog methotrexate; pyrimidine analogs fluorouracil, cytosine arabinoside; and purine analogs mecaptopurine, thioguanine, and azathioprine. Exemplary vinca alkyloids include, by way of example and not limitation, vinblastine, vincristine, paclitaxel, and colchicine. Exemplary antitumor antibiotics include, by way of example and not limitation, actinomycin D, daunorubicin, and bleomycin. An exemplary enzyme effective as anti-neoplastic agent is L-asparaginase. Exemplary coordination compounds include, by way of example and not limitation, cisplatin and carboplatin. Exemplary hormones and hormone related compounds

include, by way of example and not limitation, adrenocorticosteroids prednisone, and dexamethasone; aromatase inhibitors amino glutethimide, formestane, and anastrozole; progestin compounds hydroxyprogesteron caproate, medroxyprogesterone; and anti-estrogen compound tamoxifen. Exemplary topoisomerase inhibitors include, by way of example and not limitation, amsacrine (m- AMSA); mitoxantrone, topotecan, irinotecan, and camptothecin.

**[00160]** These and other useful anti-cancer compounds are described in Merck Index, 13<sup>th</sup> Ed. (O'Neil, MJ. Et al., ed) Merck Publishing Group (2001) and Goodman and Gilman's *The Pharmacological Basis of Therapeutics*, 10<sup>th</sup> Edition, Hardman, J.G. and Limbird, L.E. eds., pg. 1381-1287, McGraw Hill, (1996), both of which are incorporated herein by reference.

**[00161]** Typically, any chemotherapeutic agent that has activity versus a neoplasm being treated may be utilized in combination with the Heteroaryl Compounds as described herein provided that the particular agent is clinically compatible with therapy employing a Heteroaryl Compound as described herein. Typical antineoplastic agents useful in the methods described herein include, but are not limited to, anti-microtubule agents such as diterpenoids and vinca alkaloids; platinum coordination complexes; alkylating agents such as nitrogen mustards, oxazaphosphorines, alkylsulfonates, nitrosoureas, and triazenes; antibiotic agents such as anthracyclins, actinomycins and bleomycins; topoisomerase II inhibitors such as epipodophylotoxins; antimetabolites such as purine and pyrimidine analogues and anti-folate compounds; topoisomerase I inhibitors such as camptothecins; hormones and hormonal analogues; signal transduction pathway inhibitors; non-receptor tyrosine kinase angiogenesis inhibitors; immunotherapeutic agents; proapoptotic agents; and cell cycle signaling inhibitors.

**[00162]** Signal transduction pathway inhibitors are those inhibitors which block or inhibit a chemical process which evokes an intracellular change. As used herein this change is cell proliferation, survival, angiogenesis or differentiation. Signal transduction inhibitors useful in the present methods include inhibitors of receptor tyrosine kinases, non-receptor tyrosine kinases, SH2/SH3 domain blockers, serine/threonine kinases, phosphatidyl inositol-3 kinases, myoinositol signaling, and Ras oncogenes.

**[00163]** Several protein tyrosine kinases catalyse the phosphorylation of specific tyrosyl residues in various proteins involved in the regulation of cell growth. Such protein tyrosine kinases can be broadly classified as receptor or non-receptor kinases.

**[00164]** Receptor tyrosine kinases are transmembrane proteins having an extracellular ligand binding domain, a transmembrane domain, and a tyrosine kinase domain. Receptor tyrosine kinases are involved in the regulation of cell growth and are sometimes termed growth factor receptors. Inappropriate or uncontrolled activation of many of these kinases, i.e. aberrant kinase growth factor receptor activity, for example by over-expression or mutation, has been shown to result in uncontrolled cell growth. Accordingly, the aberrant activity of such kinases has been linked to malignant tissue growth. Consequently, inhibitors of such kinases could provide cancer treatment methods. Growth factor receptors include, for example, epidermal growth factor receptor (EGFr, ErbB2 and ErbB4), platelet derived growth factor receptor (PDGFR), vascular endothelial growth factor receptor (VEGFR), tyrosine kinase with immunoglobulin-like and epidermal growth factor homology domains (Tie-2), insulin growth factor-I receptor (IGF-I), macrophage colony stimulating factor (MCSF), BTK, ckit, cmet, fibroblast growth factor (FGF) receptors, Trk receptors (TrkA, TrkB, and TrkC), ephrin (eph) receptors, and the RET protooncogene. Several inhibitors of growth factor receptors are under development and include ligand antagonists, antibodies, tyrosine kinase inhibitors, anti-sense oligonucleotides and aptamers. Growth factor receptors and agents that inhibit growth factor receptor function are described, for instance, in Kath, John C, *Exp. Opin. Ther. Patents* 10{8}:803-818 (2000); and Lofts, F. J. *et al*, "Growth Factor Receptors as Targets", *New Molecular Targets for Cancer Chemotherapy*, Ed. Workman, Paul and Kerr, David, CRC Press 1994, London.

**[00165]** Tyrosine kinases, which are not growth factor receptor kinases are termed non-receptor tyrosine kinases. Non-receptor tyrosine kinases useful in the present methods are targets or potential targets of antineoplastic drugs, include cSrc, Lck, Fyn, Yes, Jak, cAbl, FAK (Focal adhesion kinase), Brutons tyrosine kinase, and Bcr-Abl. Such non-receptor kinases and agents which inhibit non-receptor tyrosine kinase function are described in Sinh, S. *et al*, *J. Hematother. Stem Cell Res.* 8 (5): 485 – 80 (1999); and Bolen, J.B. *et al*, *Ann. Rev. Immunol.* 15: 371-404 (1997).

**[00166]** SH2/SH3 domain blockers are agents that disrupt SH2 or SH3 domain binding in a variety of enzymes or adaptor proteins including, PI3-K p85 subunit, Src family kinases, adaptor molecules (Shc, Crk, Nck, Grb2) and Ras-GAP. SH2/SH3 domains as targets for anti-cancer drugs are discussed in Smithgall, T.E. (1995), *Journal of Pharmacological and Toxicological Methods* 34(3) 125-32.

**[00167]** Inhibitors of Serine/Threonine Kinases including MAP kinase cascade blockers which include blockers of Raf kinases (Rafk), Mitogen or Extracellular Regulated Kinase (MEKs), and Extracellular Regulated Kinases (ERKs); and Protein kinase C family member blockers including blockers of subtypes of PKCs (alpha, beta, gamma, epsilon, mu, lambda, iota, zeta), I $\kappa$ B kinase family (IKK $\alpha$ , IKK $\beta$ ), PKB family kinases, Akt kinase family members, and TGF beta receptor kinases. Such Serine/Threonine kinases and inhibitors thereof are described in Yamamoto, T. *et al*, *J. Biochem.* 126(5): 799-803 (1999); Brodt, P. *et al*. *Biochem. Pharmacol.* 60: 1101 -1107 (2000); Massague, J. *et al*. *Cancer Surveys* 27:41-64 (1988); Philip, PA. *et al*., *Cancer Treat. Res.* 78: 3-27 (1995), Lackey, K. *et al*. *Bioorg. Med. Chem. Lett.* 10: 223-228 (2000); and Martinez-Lacaci, L., *et al*, *Int. J. Cancer* 88(1): 44-52 (2000).

**[00168]** Inhibitors of Phosphatidylinositol-3 Kinase family members including blockers of PI3-kinase, ATM, DNA-PK, and Ku are also useful in combination with the compounds described herein. Such kinases are discussed in Abraham, RT. *Curr. Op. Immunol.* 8(3):412-8 (1996); Canman, C.E. *et al*. *Oncogene* 17(25):3301-3308 (1998); Jackson, SP. *Int. J. Biochem. Cell Biol.* 29(7):935-938 (1997); and Zhong, H. *et al*, *Cancer Res.* 60(6):1541-1545 (2000).

**[00169]** Also useful in combination with the Heteroaryl Compounds described herein are Myo-inositol signaling inhibitors such as phospholipase C blockers and Myo-inositol analogues. Such signal inhibitors are described in Powis, G. *et al*. *New Molecular Targets for Cancer Chemotherapy* ed., Paul Workman and David Kerr, CRC Press 1994, London.

**[00170]** Another group of signal transduction pathway inhibitors useful in combination with the Heteroaryl Compounds are inhibitors of Ras Oncogene. Such inhibitors include inhibitors of farnesyltransferase, geranyl-geranyl transferase, and CAAX proteases as well as anti-sense oligonucleotides, ribozymes and immunotherapy. Such inhibitors have been shown to block Ras activation in cells containing wild type mutant Ras, thereby acting as antiproliferation agents. Ras oncogene inhibition is discussed in Scharovsky, CG. *et al*. *J. Biomed. Sci.* 7(4) 292-298 (2000); Ashby, MM, *Curr. Op. Lipid.* 9(2)99-102 (1998); and Oliff, A., *Biochim. Biophys. Acta*, 1423(3): C19-C30 (1999).

**[00171]** As mentioned above, antibodies to receptor kinase ligand binding may also serve as signal transduction inhibitors. This group of signal transduction pathway inhibitors includes the use of humanized antibodies to the extracellular ligand binding domain of receptor tyrosine kinases. For example, Imclone C225 EGFR specific antibody (see Green, M. C. *et al*. *Cancer*

*Treat. Rev.*, 26(4), 280- 286 (2000)); Herceptin® ErbB2 antibody (see Stern, DF *Breast Cancer Res.*, 2(3), 176-183 (2000)); and 2CB VEGFR2 specific antibody (see Brekken, RA *et al.*, *Cancer Res.* 80, 5117-5124 (2000)).

[00172] Receptor kinase angiogenesis inhibitors may also find use in the present methods. Inhibitors of angiogenesis related VEGFR and TIE2 are discussed above in regard to signal transduction inhibitors (both receptors are receptor tyrosine kinases). Other inhibitors may be used in combination with the Heteroaryl Compounds described herein. For example, anti-VEGF antibodies, which do not recognize VEGFR (the receptor tyrosine kinase), but bind to the ligand; small molecule inhibitors of integrin ( $\alpha_v\beta_3$ ) that will inhibit angiogenesis: endostatin and angiostatin (non-RTK) may also prove useful in combination with PLK inhibitors.

[00173] Agents used in immunotherapeutic regimens may also be useful in combination with the Heteroaryl Compound as described herein.

[00174] Agents used in proapoptotic regimens (e.g., bcl-2 antisense oligonucleotides) may also be used in the combinations provided herein, Members of the Bcl-2 family of proteins block apoptosis. Upregulation of bcl-2 has therefore been linked to chemoresistance. Studies have shown that the epidermal growth factor (EGF) stimulates anti-apoptotic members of the bcl-2 family (i.e., mcl-1). Therefore, strategies designed to downregulate the expression of bcl-2 in tumors have demonstrated clinical benefit and are now in Phase II/III trials, namely Genta's G3139 bcl-2 antisense oligonucleotide. Such proapoptotic strategies using the antisense oligonucleotide strategy for bcl-2 are discussed in Water JS *et al.*, *J. Clin. Oncol* 18:1812-1823 (2000); and Kitada S *et al.*, *Antisense Res. Dev.* 4:71-79 (1994).

[00175] Cell cycle signaling inhibitors inhibit molecules involved in the control of the cell cycle. Cyclin dependent kinases (CDKs) and their interaction with cyclins control progression through the eukaryotic cell cycle. The coordinated activation and inactivation of different cyclin/CDK complexes is necessary for normal progression through the cell cycle. Several inhibitors of cell cycle signaling are under development. For instance, examples of cyclin dependent kinases, including CDK2, CDK4, and CDK6 and inhibitors for the same are described in, for instance, Rosania, *et al.*, *Exp. Opin Ther. Patents* 10(2):215- 230 (2000).

[00176] Other anti-proliferative compounds useful in combination with the Heteroaryl Compounds include, by way of example and not limitation, antibodies directed against growth factor receptors {e.g., anti-Her2}; cytokines such as interferon- $\alpha$  and interferon- $\gamma$ , interleukin-2,

and GM-CSF; and antibodies for cell surface markers {e.g., anti-CTLA-4, anti-CD20 (rituximab); anti-CD33}. When antibodies against cell surface markers are used, a chemotherapeutic agent can be conjugated to it for specific targeting to the tumor cell. Suitable conjugates include radioactive compounds {e.g., radioactive metal bound to an antibody conjugated chelator}, cytotoxic compounds, and drug activating enzymes {e.g., allinase, peptidases, esterases, catalytic antibodies, etc.} (see, e.g., Arditti *et al.*, *Mol. Cancer Therap.* 4(2):325-331 (2005); U.S. Patent No. 6,258,360; incorporated herein by reference).

[00177] In some embodiments, the Heteroaryl Compounds can be used with a second kinase inhibitor that targets an oncogenic kinase different from Syk. Given that the Heteroaryl Compounds are disclosed herein for the treatment of hematopoietic neoplasms, other compatible kinase inhibitors used for treating hematopoietic neoplasms can also be used. In some embodiments, the second kinase inhibitor is an inhibitor of Abl kinase. Chronic myelogenous leukemia is a myeloid neoplasm characterized by malignant proliferation of leukemic stem cells in the bone marrow. The majority of chronic myelogenous leukemia are associated with a cytogenetic abnormality defined by a reciprocal translocation t(9;22)(q34;q11). This chromosomal aberration results in generation of a BCR/ABL fusion protein with activated kinase activity. Inhibitors of the fusion protein kinase activity can be effective in treating chronic myelogenous leukemia although resistant forms can develop upon continued treatment. Use of the Heteroaryl Compound in combination with Abl kinase inhibitors can lessen the chances of resistant cells by targeting a different cellular process than targeted by the second kinase inhibitor. An exemplary Abl kinase inhibitor is 2-phenylaminopyrimidine, also known as imatinib mesylate and Gleevec®. Thus, in some embodiments, the Heteroaryl Compounds can be used in combination with Abl kinase inhibitor 2-phenylaminopyrimidine and its derivatives. In other embodiments, the second kinase inhibitor can be pyridol[2-3-d]pyrimidine and its derivatives, which was originally identified as inhibitors of Src kinase. In still other embodiments, the second kinase inhibitor can be tyrophostins and its derivatives (e.g., adaphostin), which can affect the association of the kinase with its substrates. Other kinase inhibitor compounds will be apparent to the skilled artisan.

[00178] Other second active agents useful in combination with Heteroaryl Compounds have activity against Syk kinase include, by way of example and not limitation, Fc-domain containing therapeutic antibodies or fusion proteins, such as infliximab or etanercept. In one embodiment,

provided herein are methods for the treatment or prevention of an autoimmune disorder, such as those known in the art or recited herein, comprising administering to a subject in need thereof a combination of a Heteroaryl Compound having activity against Syk kinase and a Fc-domain containing antibody, such as infliximab or etanercept. In one embodiment, provided herein are methods for the treatment or prevention of an inflammatory disorder, such as those known in the art or recited herein, comprising administering to a subject in need thereof a combination of a Heteroaryl Compound having activity against Syk kinase and a Fc-domain containing antibody, such as infliximab. In a particular embodiment, the Heteroaryl Compound is administered as a chronic therapy, starting before or immediately after the initial administration of the Fc-domain containing therapeutic antibody or fusion protein. Without being limited by theory, it is thought that a Heteroaryl Compound with activity against Syk kinase can extend the serum half-life of Fc-domain containing therapeutic antibodies and fusion proteins in a subject.

[00196] As described herein, there are provided methods of regulating, modulating, binding, or inhibiting PLK for the treatment of conditions mediated by PLK particularly PLK1.

“Regulating, modulating, binding or inhibiting PLK” refers to regulating, modulating, binding or inhibiting PLK, particularly PLK1 activity, as well as regulating, modulating, binding or inhibiting overexpression of PLK, particularly PLK1. Such conditions include certain neoplasms (including cancers and tumors) which have been associated with PLK, particularly PLK1, and conditions characterized by inappropriate cellular proliferation.

[00197] Also provided are methods for treating a PLK susceptible neoplasm (cancer or tumor) in a subject such as a mammal (e.g., a human) in need thereof, which method comprises administering to the subject a therapeutically effective amount of a Heteroaryl Compound described herein. “PLK susceptible neoplasm” as used herein refers to neoplasms which are susceptible to treatment with a PLK, particularly PLK1, inhibitor. Neoplasms which have been associated with PLK and are therefore susceptible to treatment with a PLK inhibitor are known in the art, and include both primary and metastatic tumors and cancers. See e.g., M. Whitfield et al, *Nature Reviews/Cancer*, 6:99 (2006). For example, PLK susceptible neoplasms include but are not limited to breast cancer, colon cancer, lung cancer (including small cell lung cancer and non-small cell lung cancer), prostate cancer, endometrial cancer, gastric cancer, melanoma, ovarian cancer, pancreatic cancer, squamous cell carcinoma, carcinoma of the head and neck, esophageal carcinoma, hepatocellular carcinoma, renal cell cancer, sarcoma (including cancers of connective tissue), bladder cancer, glioma and hematologic malignancies such as lymphoma including aggressive lymphomas and non-Hodgkins lymphoma, and leukemia including acute leukemias. In one particular embodiment, a method is provided of treating breast cancer in a subject, such as a mammal (e.g., a human) in need thereof by administering a therapeutically effective amount of a Heteroaryl Compound as described herein. In another particular embodiment, there is provided a method of treating ovarian cancer in a subject, such as a mammal (e.g., a human) in need thereof by administering a therapeutically effective amount of a Heteroaryl Compound as described herein. In another particular embodiment, there is provided a method of treating non-small cell lung cancer in a subject, such as a mammal (e.g., a human) in need thereof by administering a therapeutically effective amount of a Heteroaryl Compound as described herein. In another particular embodiment, there is provided a method of treating prostate cancer in a subject, such as a mammal (e.g., a human) in need thereof by administering a

therapeutically effective amount of a Heteroaryl Compound as described herein. In another particular embodiment, there is provided a method of treating hematologic malignancies including lymphoma, such as aggressive lymphoma and non-Hodgkins lymphoma, and leukemia such as acute leukemia in a subject, such as a mammal (e.g., a human) in need thereof by administering a therapeutically effective amount of a Heteroaryl Compound as described herein. "Acute leukemias" includes both acute myeloid leukemias and acute lymphoid leukemias. See, H. Harris, *et al*, *J Clin. Onc.* 17(12):3835-3849, (1999). "Aggressive lymphomas" is a term of art, See, J. Chan, *Hematological Onc.* 19:128-150 (2001).

[00198] Also provided are methods for treating a condition characterized by inappropriate cellular proliferation in a subject, such as a mammal (e.g., a human) in need thereof. The method comprises administering a therapeutically effective amount of a Heteroaryl Compound as described herein. By "inappropriate cellular proliferation" is meant cellular proliferation resulting from inappropriate cell growth, cellular proliferation resulting from excessive cell division, cellular proliferation resulting from cell division at an accelerated rate, cellular proliferation resulting from inappropriate cell survival, and/or cellular proliferation in a normal cell occurring at a normal rate, which is nevertheless undesired. Conditions characterized by inappropriate cellular proliferation include but are not limited to neoplasms, blood vessel proliferative disorders, fibrotic disorders, mesangial cell proliferative disorders and inflammatory/immune-mediated diseases. Blood vessel proliferative disorders include arthritis and restenosis. Fibrotic disorders include hepatic cirrhosis and atherosclerosis. Mesangial cell proliferative disorders include glomerulonephritis, malignant nephrosclerosis and glomerulopathies. Inflammatory/immune-mediated disorders include psoriasis, chronic wound healing, organ transplant rejection, thrombotic microangiopathy syndromes, and neurodegenerative diseases. Osteoarthritis and other osteoclast proliferation dependent diseases of excess bone resorption are examples of conditions characterized by inappropriate cellular proliferation in which the cellular proliferation occurs in normal cells at a normal rate, but is nevertheless undesired.

[00199] Also provided are methods for inhibiting proliferation of a cell which methods comprise contacting the cell with an amount of a Heteroaryl Compound as described herein sufficient to inhibit proliferation of the cell. In one particular embodiment the cell is a neoplastic cell. In one particular embodiment, the cell is an inappropriately proliferative cell. The term

“inappropriately proliferative cell” as used herein refers to cells that grow inappropriately (abnormally), cells that divide excessively or at an accelerated rate, cells that inappropriately (abnormally) survive and/or normal cells that proliferate at a normal rate but for which proliferation is undesired. Neoplastic cells (including cancer cells) are an example of inappropriately proliferative cells but are not the only inappropriately proliferative cells.

**[00200]** PLK is essential for cellular mitosis and accordingly, the compounds as described herein are believed to be effective for inhibiting mitosis. “Inhibiting mitosis” refers to inhibiting the entry into the M phase of the cell cycle, inhibiting the normal progression of the M phase of the cell cycle once M phase has been entered and inhibiting the normal exit from the M phase of the cell cycle. Thus, Heteroaryl Compounds as described herein may inhibit mitosis by inhibiting the cell’s entry into mitosis, by inhibiting the cell’s progression through mitosis or by inhibiting the cell’s exit from mitosis. As one aspect, provided are methods for inhibiting mitosis in a cell, which methods comprise administering to the cell an amount of a compound as described herein sufficient to inhibit mitosis, and in one particular embodiment, the cell is a neoplastic cell. In one particular embodiment, the cell is an inappropriately proliferative cell.

**[00201]** Further provided are the use of a Heteroaryl Compound as described herein for the preparation of a medicament for the treatment of condition mediated by PLK, particularly PLK1, in a subject, such as a mammal (e.g., a human). Still further provided are the use of a Heteroaryl Compound for the preparation of a medicament for the treatment of a PLK susceptible neoplasm in a subject, particularly a mammal (e.g., a human). In particular, provided are the use of a Heteroaryl Compound for the preparation of a medicament for the treatment of breast cancer. In addition, also provided are the use of a Heteroaryl Compound for the preparation of a medicament for the treatment of ovarian cancer, the use of a Heteroaryl Compound for the preparation of a medicament for the treatment of non-small cell lung cancer, the use of a Heteroaryl Compound for the preparation of a medicament for the treatment of prostate cancer, and the use of a Heteroaryl Compound for the preparation of a medicament for the treatment of hematologic malignancies, such as acute leukemias, aggressive lymphomas and non-Hodgkins lymphomas. Further provided are the use of a Heteroaryl Compound for the preparation of a medicament for the treatment of a condition characterized by inappropriate cellular proliferation, for the use of a Heteroaryl Compound for the preparation of a medicament for inhibiting

proliferation of a cell, and for the use of a Heteroaryl Compound for the preparation of a medicament for inhibiting mitosis in a cell.

**[00202]** In the above-described methods of treatment and uses, a compound as described herein may be employed alone, in combination with one or more other compounds as described herein or in combination with other therapeutic agents and/or in combination with other antineoplastic therapies. In particular, in methods of treating conditions mediated by PLK and methods of treating PLK susceptible neoplasms, combination with other chemotherapeutic agents is envisaged as well as combination with surgical therapy and radiation therapy. The term “chemotherapeutic” as used herein refers to any chemical agent having a therapeutic effect on the subject to which it is administered. “Chemotherapeutic” agents include but are not limited to antineoplastic agents, analgesics and anti-emetics. As used herein, “antineoplastic agents” include both cytostatic and cytotoxic agents such as but not limited to cytotoxic chemotherapy, hormonal therapy, targeted kinase inhibitors and therapeutic monoclonal antibodies. Combination therapies as described herein thus comprise the administration of at least one Heteroaryl Compound as described herein and the use of at least one other cancer treatment method. In one embodiment, combination therapies as provided herein comprise the administration of at least one compound as described herein and at least one other chemotherapeutic agent. One particular embodiment comprises the administration of at least one Heteroaryl Compound as described herein and at least one antineoplastic agent. As an additional aspect, also provided are the methods of treatment and uses as described above, which comprise administering a Heteroaryl Compound as described herein together with at least one chemotherapeutic agent. In one particular embodiment, the chemotherapeutic agent is an antineoplastic agent. In another embodiment, provided herein is a pharmaceutical composition as described above further comprising at least one other chemotherapeutic agent, more particularly, the chemotherapeutic agent is an anti-neoplastic agent.

**[00203]** As further described herein, the administration of other chemotherapeutic agents can be done in the form of a composition, or administered adjunctively in combination with the Heteroaryl Compound. When provided adjunctively, the chemotherapeutic agents can be administered simultaneously with or sequentially with administration of the Heteroaryl Compound.

[00204] The methods and uses employing these combinations may comprise the administration of the Heteroaryl Compound as described herein and the second active agent either sequentially in any order or simultaneously in separate or combined pharmaceutical compositions. When combined in the same formulation it will be appreciated that the two compounds must be stable and compatible with each other and the other components of the formulation and may be formulated for administration.

[00205] Administration of a Heteroaryl Compound and a second active agent to a subject can occur simultaneously or sequentially by the same or different routes of administration. The suitability of a particular route of administration employed for a particular active agent will depend on the active agent itself (*e.g.*, whether it can be administered orally without decomposing prior to entering the blood stream) and the disease being treated. One route of administration for Heteroaryl Compounds is oral. Preferred routes of administration for the second active agents or ingredients as described herein are known to those of ordinary skill in the art. *See, e.g., Physicians' Desk Reference*, 1755-1760 (56<sup>th</sup> ed., 2002).

[00206] In one embodiment, the second active agent is administered intravenously or subcutaneously. In another embodiment, the second active agent is administered intravenously or subcutaneously once or twice daily in an amount of from about 1 to about 1000 mg, from about 5 to about 500 mg, from about 10 to about 350 mg, or from about 50 to about 200 mg. The specific amount of the second active agent will depend on the specific agent used, the type of disease being treated or managed, the severity and stage of disease, and the amount(s) of a Heteroaryl Compound and any optional additional active agents concurrently administered to the subject.

[00207] Further provided herein are methods of reducing, treating and/or preventing adverse or undesired effects associated with conventional therapy including, but not limited to, surgery, chemotherapy, radiation therapy, hormonal therapy, biological therapy and immunotherapy. Heteroaryl Compounds and other active ingredients can be administered to a subject prior to, during, or after the occurrence of the adverse effect associated with conventional therapy.

#### 4.5 PHARMACEUTICAL COMPOSITIONS AND ROUTES OF ADMINISTRATION

[00208] In one aspect provided herein are pharmaceutical compositions comprising an effective amount of a Heteroaryl Compound or a pharmaceutically acceptable salt, tautomer, stereoisomer, solvate or prodrug thereof; and a pharmaceutically acceptable carrier, excipient or vehicle.

[00209] In one embodiment provided herein are pharmaceutical compositions suitable for oral, parenteral, mucosal, transdermal or topical administration.

[00210] The Heteroaryl Compounds can be administered to a subject orally or parenterally in the conventional form of preparations, such as capsules, microcapsules, tablets, granules, powder, troches, pills, suppositories, injections, suspensions and syrups. Suitable formulations can be prepared by methods commonly employed using conventional, organic or inorganic additives, such as an excipient (*e.g.*, sucrose, starch, mannitol, sorbitol, lactose, glucose, cellulose, talc, calcium phosphate or calcium carbonate), a binder (*e.g.*, cellulose, methylcellulose, hydroxymethylcellulose, polypropylpyrrolidone, polyvinylpyrrolidone, gelatin, gum arabic, polyethyleneglycol, sucrose or starch), a disintegrator (*e.g.*, starch, carboxymethylcellulose, hydroxypropylstarch, low substituted hydroxypropylcellulose, sodium bicarbonate, calcium phosphate or calcium citrate), a lubricant (*e.g.*, magnesium stearate, light anhydrous silicic acid, talc or sodium lauryl sulfate), a flavoring agent (*e.g.*, citric acid, menthol, glycine or orange powder), a preservative (*e.g.*, sodium benzoate, sodium bisulfite, methylparaben or propylparaben), a stabilizer (*e.g.*, citric acid, sodium citrate or acetic acid), a suspending agent (*e.g.*, methylcellulose, polyvinyl pyrrolidone or aluminum stearate), a dispersing agent (*e.g.*, hydroxypropylmethylcellulose), a diluent (*e.g.*, water), and base wax (*e.g.*, cocoa butter, white petrolatum or polyethylene glycol). The effective amount of the Heteroaryl Compound in the pharmaceutical composition may be at a level that will exercise the desired effect; for example, about 0.005 mg/kg of a subject's body weight to about 10 mg/kg of a subject's body weight in unit dosage for both oral and parenteral administration.

[00211] The dose of a Heteroaryl Compound to be administered to a subject is rather widely variable and can be subject to the judgment of a health-care practitioner. In general, the Heteroaryl Compounds can be administered one to four times a day in a dose of about 0.005 mg/kg of a subject's body weight to about 10 mg/kg of a subject's body weight in a

subject, but the above dosage may be properly varied depending on the age, body weight and medical condition of the subject and the type of administration. In one embodiment, the dose is about 0.01 mg/kg of a subject's body weight to about 5 mg/kg of a subject's body weight, about 0.05 mg/kg of a subject's body weight to about 1 mg/kg of a subject's body weight, about 0.1 mg/kg of a subject's body weight to about 0.75 mg/kg of a subject's body weight or about 0.25 mg/kg of a subject's body weight to about 0.5 mg/kg of a subject's body weight. In one embodiment, one dose is given per day. In any given case, the amount of the Heteroaryl Compound administered will depend on such factors as the solubility of the active component, the formulation used and the route of administration.

**[00212]** In another embodiment, provided herein are methods for the treatment or prevention of a disease or disorder comprising the administration of about 0.375 mg/day to about 750 mg/day, about 0.75 mg/day to about 375 mg/day, about 3.75 mg/day to about 75 mg/day, about 7.5 mg/day to about 55 mg/day or about 18 mg/day to about 37 mg/day of a Heteroaryl Compound to a subject in need thereof.

**[00213]** In another embodiment, provided herein are methods for the treatment or prevention of a disease or disorder comprising the administration of about 1 mg/day to about 1200 mg/day, about 10 mg/day to about 1200 mg/day, about 100 mg/day to about 1200 mg/day, about 400 mg/day to about 1200 mg/day, about 600 mg/day to about 1200 mg/day, about 400 mg/day to about 800 mg/day or about 600 mg/day to about 800 mg/day of a Heteroaryl Compound to a subject in need thereof. In a particular embodiment, the methods disclosed herein comprise the administration of 400 mg/day, 600 mg/day or 800 mg/day of a Heteroaryl Compound to a subject in need thereof.

**[00214]** In another embodiment, provided herein are unit dosage formulations that comprise between about 1 mg and 200 mg, about 35 mg and about 1400 mg, about 125 mg and about 1000 mg, about 250 mg and about 1000 mg, or about 500 mg and about 1000 mg of a Heteroaryl Compound.

**[00215]** In a particular embodiment, provided herein are unit dosage formulation comprising about 100 mg or 400 mg of a Heteroaryl Compound.

**[00216]** In another embodiment, provided herein are unit dosage formulations that comprise 1 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg, 35 mg, 50 mg, 70 mg, 100 mg, 125 mg, 140 mg,

175 mg, 200 mg, 250 mg, 280 mg, 350 mg, 500 mg, 560 mg, 700 mg, 750 mg, 1000 mg or 1400 mg of a Heteroaryl Compound.

[00217] A Heteroaryl Compound can be administered once, twice, three, four or more times daily. In a particular embodiment, doses of 600 mg or less are administered as a once daily dose and doses of more than 600 mg are administered twice daily in an amount equal to one half of the total daily dose.

[00218] A Heteroaryl Compound can be administered orally for reasons of convenience. In one embodiment, when administered orally, a Heteroaryl Compound is administered with a meal and water. In another embodiment, the Heteroaryl Compound is dispersed in water or juice (e.g., apple juice or orange juice) and administered orally as a suspension.

[00219] The Heteroaryl Compound can also be administered intradermally, intramuscularly, intraperitoneally, percutaneously, intravenously, subcutaneously, intranasally, epidurally, sublingually, intracerebrally, intravaginally, transdermally, rectally, mucosally, by inhalation, or topically to the ears, nose, eyes, or skin. The mode of administration is left to the discretion of the health-care practitioner, and can depend in-part upon the site of the medical condition.

[00220] In one embodiment, provided herein are capsules containing a Heteroaryl Compound without an additional carrier, excipient or vehicle.

[00221] In another embodiment, provided herein are compositions comprising an effective amount of a Heteroaryl Compound and a pharmaceutically acceptable carrier or vehicle, wherein a pharmaceutically acceptable carrier or vehicle can comprise an excipient, diluent, or a mixture thereof. In one embodiment, the composition is a pharmaceutical composition.

[00222] The compositions can be in the form of tablets, chewable tablets, capsules, solutions, parenteral solutions, troches, suppositories and suspensions and the like. Compositions can be formulated to contain a daily dose, or a convenient fraction of a daily dose, in a dosage unit, which may be a single tablet or capsule or convenient volume of a liquid. In one embodiment, the solutions are prepared from water-soluble salts, such as the hydrochloride salt. In general, all of the compositions are prepared according to known methods in pharmaceutical chemistry. Capsules can be prepared by mixing a Heteroaryl Compound with a suitable carrier or diluent and filling the proper amount of the mixture in capsules. The usual carriers and diluents include, but are not limited to, inert powdered substances such as starch of many different kinds,

powdered cellulose, especially crystalline and microcrystalline cellulose, sugars such as fructose, mannitol and sucrose, grain flours and similar edible powders.

**[00223]** Tablets can be prepared by direct compression, by wet granulation, or by dry granulation. Their formulations usually incorporate diluents, binders, lubricants and disintegrators as well as the compound. Typical diluents include, for example, various types of starch, lactose, mannitol, kaolin, calcium phosphate or sulfate, inorganic salts such as sodium chloride and powdered sugar. Powdered cellulose derivatives are also useful. In one embodiment, the pharmaceutical composition is lactose-free. Typical tablet binders are substances such as starch, gelatin and sugars such as lactose, fructose, glucose and the like. Natural and synthetic gums are also convenient, including acacia, alginates, methylcellulose, polyvinylpyrrolidone and the like. Polyethylene glycol, ethylcellulose and waxes can also serve as binders.

**[00224]** A lubricant might be necessary in a tablet formulation to prevent the tablet and punches from sticking in the die. The lubricant can be chosen from such slippery solids as talc, magnesium and calcium stearate, stearic acid and hydrogenated vegetable oils. Tablet disintegrators are substances that swell when wetted to break up the tablet and release the compound. They include starches, clays, celluloses, algins and gums. More particularly, corn and potato starches, methylcellulose, agar, bentonite, wood cellulose, powdered natural sponge, cation-exchange resins, alginic acid, guar gum, citrus pulp and carboxymethyl cellulose, for example, can be used as well as sodium lauryl sulfate. Tablets can be coated with sugar as a flavor and sealant, or with film-forming protecting agents to modify the dissolution properties of the tablet. The compositions can also be formulated as chewable tablets, for example, by using substances such as mannitol in the formulation.

**[00225]** When it is desired to administer a Heteroaryl Compound as a suppository, typical bases can be used. Cocoa butter is a traditional suppository base, which can be modified by addition of waxes to raise its melting point slightly. Water-miscible suppository bases comprising, particularly, polyethylene glycols of various molecular weights are in wide use.

**[00226]** The effect of the Heteroaryl Compound can be delayed or prolonged by proper formulation. For example, a slowly soluble pellet of the Heteroaryl Compound can be prepared and incorporated in a tablet or capsule, or as a slow-release implantable device. The technique also includes making pellets of several different dissolution rates and filling capsules with a

mixture of the pellets. Tablets or capsules can be coated with a film that resists dissolution for a predictable period of time. Even the parenteral preparations can be made long-acting, by dissolving or suspending the Heteroaryl Compound in oily or emulsified vehicles that allow it to disperse slowly in the serum.

The mixture was refluxed (117 °C) for 1 h, resulting in a conversion to the desired product with further demethylation to 4-((2-(4-(trifluoromethyl)phenylamino)-[1,2,4]triazolo[1,5-*a*]pyridin-5-yl)methyl)pyridin-2(*1H*)-one. The product was then extracted in ethyl acetate. The extracts were dried over magnesium sulfate and evaporated to dryness. No purification or separation was attempted. 5-((2-Methoxypyridin-4-yl)methyl)-*N*-(4-(trifluoromethyl)phenyl)-[1,2,4]triazolo[1,5-*a*]pyridin-2-amine (0.307 g, 0.769 mmol, 75 % yield) contaminated with 4-((2-(4-

The conversion was performed in two batches (0.215 g and 0.092 g) that were recombined prior to work-up and purification. To a suspension of 5-((2-methoxypyridin-4-yl)methyl)-*N*-(4-(trifluoromethyl)phenyl)-[1,2,4]triazolo[1,5-*a*]pyridin-2-amine (0.215 g, 0.538 mmol) in acetonitrile (1.252 mL) was added trimethylsilyl chloride (0.076 mL, 0.592 mmol) and potassium iodide (0.098 g, 0.592 mmol). The reaction was heated to 60 °C overnight. The crude reaction was quenched with water. After recombining reaction mixtures, the crude was extracted in ethyl acetate, the extracts were dried over magnesium sulfate and evaporated to dryness. Upon re-suspending the evaporated extracts in ethyl acetate, a yellow solid formed that was collected by filtration and washed with methanol and water. ### 5.2.1 Syk HTRF Assay Protocol

[00918] Test compounds were prepared at a concentration of 1.5 mM in DMSO followed by 3-fold dilutions in Greiner 394 well polypropylene plates. A 1:4 dilution of compounds by 8 μL/well transfer from the polypropylene plates to 24 μL/well Assay Buffer in Costar 3710 384 well black plates was then performed. Syk start mix (87.5 μM ATP, 80 nM Substrate Peptide (American Peptide Company 332722)) was added and the mixture was incubated at room temperature for 1 hour. Syk Stop Solution (120 mM EDTA in dilution buffer) was then added to the Syk HTRF assay plate and incubated at room temperature on a shaker for 2 minutes. Syk Antibody Mix (4.86 μg/mL DyLight 647 Streptavidin (Pierce 21824); 1 μg/mL Lance Eu-Anti-Phosphotyrosine (PerkinElmer AD0069)) was added to the Syk HTRF assay plate and the mixture was further incubated at room temperature for >4h. Time resolved fluorescence was read in assay plates on a PerkinElmer EnVision. HTRF assays were performed using 320 nm excitation, 60 μs delay, 665 nm and 615 nm emission. ### 5.2.2 HTRF-Ulight PLK1 Enzyme Assay

[00919] The assay described below is designed to measure the activity of PLK1 kinase via the transfer of phosphate to a peptide substrate. The PLK1 kinase assay was carried out in a 384-well black plate (Corning cat#3710) at a final volume of 25 μL. ATP was used at a final concentration of 3 μM, 1X the apparent K<sub>m</sub>. PLK1 kinase was purchased from Carna

Biosciences (cat #05-157) and was diluted in Assay Buffer (50 mM HEPES pH 7.6, 1mM DTT, 10 mM MgCl<sub>2</sub>, 0.01% triton X-100, 0.01% BSA, 0.1 mM EDTA) to give a final assay concentration of 15 ng/well (11 nM). The peptide substrate, ULight-p70 S6K (Thr389) Peptide and Europium-anti-phospho-p70 S6K (Thr389) Antibody were purchased from PerkinElmer (cat# TRF0126, TRF0214). Test compound was diluted in 100% DMSO and 0.5 µL was added to 14.5 µL kinase. Enzyme and compound were allowed to equilibrate at room temperature for 15 minutes. The reaction was started with the addition of 10 µL 2.5X ATP and 2.5X ULight-p70S6K peptide (25 nM final assay condition) in Assay Buffer. Reactions were allowed to proceed for 90 minutes before addition of 10 µL Stop Solution/Detection mix (14 mM EDTA, 0.5 nM Eu-anti-phos-p70 AB final). After 30 minute incubation at room temperature, the reactions were read on the Envision (excitation at 330 nM and emission filters at 665 nM and 615 nM).

A 1:4 dilution of compounds by 8  $\mu$ L/well transfer from the polypropylene plates to 24  $\mu$ L/well Assay Buffer (50 mM HEPES pH 7.6, 1 mM DTT, 10 mM  $MgCl_2$ , 0.01% Triton X100, 0.01% BSA and 0.1 mM EDTA) in Costar 3573 384 well black plates was then performed. Kinase (13  $\mu$ L/well of 4.6 ng/mL JAK2, Millipore 14-511) or Assay Buffer only (background controls) were added to Costar 3573 384-well black plates and compound (2  $\mu$ L/ well) was added from the 1:4 dilution plate. Substrate/detection mixture (10  $\mu$ L/ well) (30 nM DyLight 647-Streptavidin (Pierce 21824), 750 ng/mL Eu-anti-phospho-Tyrosine PerkinElmer AD0069), 37.5  $\mu$ M ATP and 500 nM FLT3 (Tyr 589) Biotinylated Peptide (Cell Signaling Technology 1305) was added and the mixture was incubated at room temperature for 1 hour. 10  $\mu$ L/well of a mixture of 60 mM EDTA/0.01% Triton X100 was then added to the JAK2 HTRF assay plate and mixed on a shaker for 2 minutes. The mixture was further incubated at room temperature for  $>1$ h. Time resolved fluorescence was read in assay plates on a PerkinElmer EnVision. HTRF assays were performed using 320 nm excitation, 60  $\mu$ s delay, 665 nm and 615 nm emission. Data was expressed by division of 665 nm by 615 nm emissions.

[00924] Heteroaryl Compounds as described herein were shown to have, or will be shown to have an  $IC_{50}$  value of  $<10 \mu$ M, with some compounds having an  $IC_{50}$  of  $<1 \mu$ M, and others an  $IC_{50}$  of  $<0.1 \mu$ M.

#### 5.2.5 Syk Functional Assay Protocol:CD69 expression in anti-IgM stimulated primary B-cells

[00925] Primary B-cells were purified from Buffy coat cell preparations obtained from healthy human donors at San Diego Blood Bank (SDBB). Cells were maintained in RPMI/10% FBS. Cells were counted and the cell density was adjusted to 1 mln/mL in RPMI

growth media. A compound pretreatment plate in a 96 well round-bottom format was prepared with enough cell volume to cover the desired number of wells, assuming 50  $\mu\text{L}$  cells/ well in the treatment plate. In a separate 96 well plate, compounds were diluted 1:50 into RPMI growth media. 22  $\mu\text{L}$  of the diluted compound solution was added to 200  $\mu\text{L}$  cells in the compound pretreatment plate. The mixture was placed in a tissue culture incubator for 30-60 minutes. 20  $\mu\text{g}/\text{mL}$  anti-IgM solution in RPMI growth media was prepared and 50  $\mu\text{L}$  was added per well into a new 96 well round bottom plate (cell stimulation plate). 50  $\mu\text{L}$  of compound pretreated cells were added to the anti-IgM containing plate using a multichannel pipettor and the mixture was incubated for 12-14 hours at 37°C. Following incubation, the plate was spun at 1200 rpm for 5 minutes and the media was removed. 100  $\mu\text{L}$  of CD69 antibody solution per well was added, the plate was gently tapped to mix, then incubated in the dark at room temperature for 30 minutes. Following 30 minutes of incubation the plate was spun, and washed once with 250  $\mu\text{L}$  stain buffer then spun to retrieve the final cell pellet which was resuspended in 100  $\mu\text{L}$  stain buffer and read on the cytometer for % positive.

[00926] Heteroaryl Compounds as described herein have, or are expected to have an  $\text{IC}_{50}$  value of <10  $\mu\text{M}$ , with some compounds having an  $\text{IC}_{50}$  of <1  $\mu\text{M}$ , and others an  $\text{IC}_{50}$  of <0.1  $\mu\text{M}$ .

#### 5.2.6 Syk Functional Assay: IgE-dependent beta-hexosaminidase secretion from the LAD2 human mast cell line

[00927] LAD2 cells (NIH; Kirshenbaum, *et al.*, *Leukemia Research* 27:677-682, 2003) were plated into a 96 well format, sensitized through Fc $\epsilon$ R with NP-IgE, and degranulated by crosslinking with NP<sub>16</sub>-BSA. The supernatants were collected and the secretory granule components including beta-hexosaminidase were measured in various colorimetric assays.

[00928] Briefly, LAD2 cells were gently dislodged from a culture flask, collected, and spun down at 1200 rpm for 5 minutes. The spent culture media was removed and saved and the cells were resuspended at 0.8- 1 million/mL in spent culture media. 100  $\mu\text{L}$  of 0.5  $\mu\text{g}/\text{mL}$  NP-IgE was plated in the spent culture media into a round bottom 96 well plate. 100  $\mu\text{L}$  cells were added to the plate and placed back in a tissue culture incubator for 12-14 hours to sensitize the cells and load the Fc $\epsilon$ R receptors. Following a 12-14 hour incubation the plate was spun at 1200 rpm for 5 minutes. The media was removed with a multichannel pipettor and the cell pellets were resuspended in 100  $\mu\text{L}$  Modified Tyrode's buffer. The cells were allowed to rest for 3.5 hours in

a tissue culture incubator. The compounds were diluted 1:50 in Modified Tyrode's buffer and then 11  $\mu\text{L}$  of compound solution was added to each well (giving a 0.2% DMSO final concentration). The compound was pre-incubated for 30-60 minutes in a tissue culture incubator. Following pre-incubation 12  $\mu\text{L}$  of 1.0  $\mu\text{g}/\text{mL}$  NP<sub>16</sub>-BSA diluted in Modified Tyrode's buffer was added, making the total volume in the well 123  $\mu\text{L}$ . Ionomycin at 100 nM final can be added instead of NP-BSA as a Syk-independent control for stimulation. The plate was incubated in a tissue culture incubator for 90 minutes. Following incubation the plate was spun at 1200 rpm for 5 minutes, and 75  $\mu\text{L}$  of supernatant (SN) was transferred to an empty 96 well plate for storage. The remaining SN was removed from the cell plate and discarded. 125  $\mu\text{L}$  0.1% triton X-100 in Modified Tyrode's buffer was added to the cell pellet, pipetted up/down to lyse the cells and the mixture was incubated on ice for 15 min. 30  $\mu\text{L}$  SN from the storage plate or 5  $\mu\text{L}$  cell pellet lysate plus 25  $\mu\text{L}$  0.1 % Triton solution was added to a new 96 well flat-bottom plate in identical layout for the final plate read. 150  $\mu\text{L}$  PNAG substrate was added to all wells and the plate was incubated at 37°C for 1 hour. 50  $\mu\text{L}$  stop solution (0.32 M glycine, 2.4 g/100 mL; 0.2 M sodium carbonate, 2.5 g/100 mL) was added to each well and the plate was read immediately at 405 nm. Data is expressed as % release per well (after subtracting background from all wells) =  $100 \times (\text{SN} / (\text{SN} + 6 \times \text{cell lysate}))$ .

**[00929]** Heteroaryl Compounds as described herein have, or are expected to have an IC<sub>50</sub> value of <10  $\mu\text{M}$ , with some compounds having an IC<sub>50</sub> of <1  $\mu\text{M}$ , and others an IC<sub>50</sub> of <0.1  $\mu\text{M}$ .

#### 5.2.7 CD14+ derived macrophage cell based assay

**[00930]** Cryopreserved human CD14+ monocytic cells were isolated from peripheral blood of screened, healthy donors given G-CSF (Neupogen) for 4 days to mobilize cells to the peripheral blood (Lonza). CD14+ Monocytes were isolated using positive immunomagnetic selection directed against CD14. Cells were cultured in growth media containing RPMI 1640, 10% FBS and Penicillin + Streptomycin and were then plated at 50,000 cells/200  $\mu\text{L}$  well of Growth Medium supplemented with 100 ng/mL GM-CSF (Pepro Tech) for 5 days in 5% CO<sub>2</sub> and 37 °C incubator to differentiate the cells into macrophages. Following differentiation, CD14+ derived macrophages were pretreated with compound for 30 minutes and stimulated with Biotin-SP conjugated goat anti-human IgG (Jackson ImmunoResearch Labs) for 8 hours in a 96- well format in 5% CO<sub>2</sub> and 37°C incubator. Following incubation, 100  $\mu\text{L}$ /well supernatant was

collected and transferred to a new 96 well U bottom plate for measurement of TNF- $\alpha$  using the Mesoscale Discovery human TNF- $\alpha$  cytokine assay.

[00931] Heteroaryl Compounds as described herein have, or are expected to have an IC<sub>50</sub> value of <10  $\mu$ M, with some compounds having an IC<sub>50</sub> of < 1  $\mu$ M, and others an IC<sub>50</sub> of <0.1  $\mu$ M.

5.2.8 Syk Biomarker Assay Protocol:phosphoBLNK measurement by PhosFlow in anti-IgM stimulated Ramos.

[00932] Ramos B-cell lymphoma (clone RA1, CRL1596; ATCC) cells were suspended at 1 mln/mL in spent culture media. A compound pretreatment plate was prepared in a 96 well round-bottom format with enough cell volume to cover the desired number of wells, assuming 50  $\mu$ L cells/ well in the treatment plate (e.g. for 4 wells 200  $\mu$ L cells was added). In a separate 96 well plate, compounds were diluted 1:50 into spent culture media. 22  $\mu$ L of diluted compound was added to 200  $\mu$ L cells in the compound pretreatment plate and the plate was placed back in the tissue culture incubator for 30-60 minutes. 50  $\mu$ L of anti-IgM (AffiniPure F(ab') fragment goat anti-human IgM (Jackson, cat. 109-006-129, 1.3 mg/mL) (40  $\mu$ g/mL in spent culture media) per well was added into a new 96 well round bottom plate (cell stimulation plate). Using a multichannel pipettor, 50  $\mu$ L of compound pretreated cells were quickly added to the anti-IgM containing plate, and the plate was placed back in the tissue culture incubator for 10 minutes. An equal volume (100  $\mu$ L) of prewarmed CytoFix reagent was added to all wells of the cell stimulation plate and the plate was placed back into the tissue culture incubator for 10 minutes, then spun at 1200 rpm for 5 minutes. The media was gently dumped out and the plate was blotted dry. Perm/Wash Buffer (100  $\mu$ L) was added to all wells and the plate was left at room temperature for 10 minutes, then spun at 1200 rpm for 5 minutes. The media was gently dumped out and the plate was blotted dry. The cells were then washed three times with 200  $\mu$ L BSA Stain Buffer (BD Pharmingen, cat 554657), the plate was spun and the supernatant was removed. 100  $\mu$ L of pBLNK antibody solution (PE mouse anti-phosphoBLNK (pY84, BD Pharmingen, cat. 558442) per well was added to the plate, gently mixed and then incubated in the dark at room temperature for 30 minutes. The plate was washed once with 200  $\mu$ L BSA Stain buffer, spun and the supernatant was removed. The final cell pellet was resuspended in 100  $\mu$ L BSA Stain buffer and read on a cytometer.

[00933] Heteroaryl Compounds have, or are expected to have, an  $IC_{50}$  below 30  $\mu M$  in this assay, with some compounds having an  $IC_{50}$  below 10  $\mu M$ , and others having an  $IC_{50}$  below 1  $\mu M$ .

5.2.9 Syk Biomarker Assay Protocol: pSyk (Y525/526) expression in tetracycline induced TEL-Syk expressing HEK 293 cells by In-Cell Western.

[00934] A stable clone expressing the Tel-Syk protein, containing N-terminal Tel (a.a. 1-336) fused to the catalytic domain (a.a. 341-612) of Syk, was generated in the HEK 293 T-REx™ cell line. Cells are maintained in DMEM/10% tetracycline free FBS with 0.5 mg/mL zeocin and 5  $\mu g/mL$  blasticidin. Cells are seeded at 50,000 per well in a black poly-D-lysine coated 96-well plate and rested overnight at 37°C, 5% CO<sub>2</sub>. Tel-Syk expression is induced with 1  $\mu g/mL$  tetracycline for 6 hours at 37°C, 5% CO<sub>2</sub>. Following the induction, cells are treated with diluted compounds for 90 minutes. After compound incubation, the cells are fixed in 150  $\mu l$  of 4% formaldehyde for 20 min, then permeabilized in PBS + 0.1% Triton X-100 by washing five times for 5 min for a total of 25 minutes. The plate is blocked with 100  $\mu l$  Odyssey blocking buffer (Licor) for at least 90 min, then incubated in 100  $\mu l$  of primary antibody solution (rabbit anti-Syk pY525/526 at 1:1000, and mouse anti-V5 at 1:2500 in Odyssey blocking buffer) overnight at 4 °C on a rocking platform. The plate is washed 5 times for 5 min with PBS + 0.1% Tween-20 (PBST) on a shaker at room temperature. The secondary antibody solution (anti-rabbit AF680 at 1:1000, and anti-mouse IR800 at 1:1000 in Odyssey blocking buffer) is added at 100  $\mu l$  per well and the plate is incubated for one hour at room temperature, shaking. The plate is then washed 5 times for 5 minutes with PBST and the buffer removed by aspiration after the final wash. The plate is scanned on the Licor Odyssey and the pSyk expression is normalized to V5.

5.2.10 Syk functional assay: Cell-Titer Glo Viability assay in SU-DHL-4, SU-DHL-5 and Pfeiffer cells.

[00936] The assay was designed to measure cytotoxic activity of the Heteroaryl Compounds in DLBCL cells. SU-DHL-4, SU-DHL-5 and Pfeiffer cells were obtained from DSMZ (German Collection of Microorganisms and Cell Cultures). Culture medium was RPMI-1640

supplemented with 10% fetal bovine serum (FBS) and 100 units/mL penicillin/100 µg/mL streptomycin.

**[00937]** Briefly, 100 µL of a cell suspension containing 10,000 cells was plated into each well of 96-well opaque-walled plates. Compounds and controls were serially diluted in DMSO and culture medium according to standard compound dilution protocol. 11 µL of compound dilutions, including the DMSO control, was added in triplicate to the cells using a repeat pipettor. This yielded final concentrations of 30 µM, 10 µM, 3 µM, 1 µM, and 0.3 µM containing 0.2% DMSO in each well. After 72 h of compound treatment, the cell viability was determined with CellTiter-Glo Reagent according to the manufacturer's protocol. Briefly, 100 µL of reconstituted CellTiter-Glo Reagent was added to each well of the 96-well plate. Luminescence signals were measured using the Victor 2 microplate reader. For each cell line, IC<sub>50</sub> was calculated using vehicle DMSO control as 100%.

**[00943]** Frozen PBMC from CLL patients (Conversant Healthcare Systems, Inc.) were thawed, washed once and suspended in RPMI (Invitrogen) supplemented with 10 % FBS

(HyClone) at 1 million cells/mL. Typically, PBMC presenting more than 90% CD19+CD5+ blasts cells as assessed by flow cytometry (using BD Biosciences antibodies) were used for the assays. #### 5.2.13 In Vivo Passive Cutaneous Anaphylaxis and passive Arthus reaction in the Rat

**[00947]** Intradermal injection of antibodies specific to dinitrophenol (DNP; rat-antiDNP IgE (PCA) or anti-DNP IgG (Arthus reaction)) followed by intravenous (IV) injection of antigen (DNP-BSA) causes a rapid inflammatory response characterized by mast cell degranulation, vascular leakage and immune complex deposition at the injection sites. In this model system, test compounds are administered at several timepoints prior to administration of antigen. A solution of rat anti-DNP IgE or IgG (1:1000 dilution) is injected intradermally. Twenty four hours later an intravenous injection of DNP conjugated to bovine serum albumin (DNP-BSA; 1 mg/kg of body weight) in solution containing 2% Evans blue dye is administered. The degree of edema is measured in the dorsal skin of CD/IGS rats using Evan's blue dye as an indicator of local tissue edema. Dye is extracted from the tissue following formamide incubation and the absorbance of this extract is read at 610nm.

**[00948]** Heteroaryl Compounds as described herein have, or are expected to have, an ED<sub>50</sub> value of <100 mg/kg, with some compounds having an ED<sub>50</sub> of <10 mg/kg, and others an ED<sub>50</sub> of <1 mg/kg.

#### 5.2.14 In Vivo Collagen induced arthritis (CIA) model in the rat

[00949] Rheumatoid arthritis (RA) is characterized by chronic joint inflammation eventually leading to irreversible cartilage destruction. IgG-containing immune complexes are abundant in the synovial tissue of subjects with RA. CIA is a widely accepted animal model of RA that results in chronic inflammatory synovitis characterized by pannus formation and joint degradation. In this model, intradermal immunization with native type II collagen, emulsified with incomplete Freund's adjuvant, results in an inflammatory polyarthritis within 10 or 11 days and subsequent joint destruction in 3 to 4 weeks.

[00950] Briefly, Porcine type II collagen is emulsified 1:1 with incomplete Freund's adjuvant and female Lewis rats are injected intradermally at 10 sites in the dorsal area, using 100  $\mu$ L of collagen per site on day 0. Beginning on the day of arthritis onset (Day 10) animals are dosed either with vehicle control or compound. Hind limbs are scored daily for clinical arthritis severity using a standardized method based on the degree of joint inflammation. Radiographs of hind limbs are obtained at the conclusion of the study and these limbs are analyzed for histopathologic changes. IgG antibodies to native collagen can be measured.

[00951] Heteroaryl Compounds as described herein have, or are expected to have an ED<sub>50</sub> value of <100 mg/kg, with some compounds having an ED<sub>50</sub> of <10 mg/kg, and others an ED<sub>50</sub> of <1 mg/kg.

#### 5.2.15 Xenograft cancer model

[00952] Human cancer cell lines are injected into athymic nude mice. For cells maintained in vitro, tumors are generated by injecting precisely determined numbers of cells into mice. For tumors which are best propagated in vivo, tumor fragments from donor mice are implanted into small numbers of mice for maintenance, or larger numbers of mice for study initiation. A typical efficacy study design involves administering one or more drugs to tumor-bearing mice. Additionally, reference chemotherapeutic agents (positive control) and negative controls are similarly administered and maintained. Routes of administration can include subcutaneous (SC), intraperitoneal (IP), intravenous (IV), intramuscular (IM) and oral (PO). Tumor measurements and body weights are taken over the course of the study and morbidity and mortality are recorded. Necropsy, histopathology, bacteriology, parasitology, serology and PCR can also be performed to enhance understanding of disease and drug action.

[00953] Some of the typical human cancer cell lines that can be used in the above xenograft models are: the MDA MB-231, MCF7, MDA-MB-435, and T-47D cell lines for breast cancer; the KM 12, HCT- 15, COLO 205, HCT-116 and HT29 cell lines for colon cancer; the NCI-H460 and A549 cell lines for lung cancer; the CRW22, LNCAP, PC-3, PCC-3, and DU-145 cell lines for prostate cancer; the LOX-IMVI and A375 cell line for melanoma; the SK-O V-3 and A2780 cell lines for ovarian cancer; and the CAKI-I, A498, SN12C cell lines for renal cancer U-87MG cell line for glioma cancer, and SU-DHL-4 cell line for hematological cancer.

[00954] Heteroaryl Compounds as described herein have, or are expected to have an ED<sub>50</sub> value of <100 mg/kg, with some compounds having an ED<sub>50</sub> of <10 mg/kg, and others an ED<sub>50</sub> of <1 mg/kg.

#### 5.2.16 Rat anti-GBM glomerulonephritis a model for Goodpasture's Disease

[00955] Inbred Sprague-Dawley rats were immunized with 5 mg (subcutaneous) sheep IgG in Freund's complete adjuvant followed 5 days later (termed day 0) by intravenous injection of sheep anti-rat glomerular basement membrane (GBM) serum (10 mg). Neutrophil and macrophage accumulation in the kidneys was measured by immunohistochemistry (IHC) at 3 h, 6 h and 24 h post IV injection of sheep anti-rat GBM. After 24 h, the disease was progressive with increasing severity of proteinuria and the development of significant glomerular and tubulointerstitial damage by day 14. This was measured by histology, serum creatinine and urine was collected for urinary protein levels as assessed by the benzethonium chloride method (McDowell TL, Benzethonium Chloride method for proteins adapted to centrifugal analysis, Clin Chem 31 (6); 864 (1985). Animals are dosed with either vehicle control or compound, either prior to or at designated timepoints post IV injection of sheep anti-rat GBM serum.

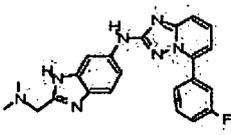

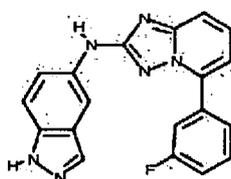

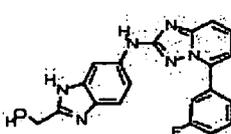

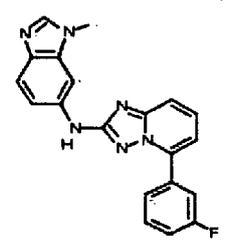

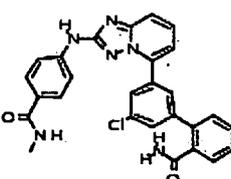

[00956] Heteroaryl Compounds as described herein have or are expected to have an ED<sub>50</sub> value of <100 mg/kg, with some compounds having an ED<sub>50</sub> of <10 mg/kg, and others an ED<sub>50</sub> of <1 mg/kg.
